</table>
H9.2.47   ID_AA64MMFR1_EL1, Memory Model Feature Register 1

The ID_AA64MMFR1_EL1 characteristics are:

**Purpose**

Reserved for future expansion of the information about the implemented memory model and memory management support in AArch64.

This register is part of the Identification registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

**Configurations**

ID_AA64MMFR1_EL1 is architecturally mapped to AArch64 register ID_AA64MMFR1_EL1.

ID_AA64MMFR1_EL1 is in the Debug power domain.

**Attributes**

ID_AA64MMFR1_EL1 is a 64-bit register.

The ID_AA64MMFR1_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
</tr>
</thead>
<tbody>
<tr>
<td>63 0</td>
</tr>
<tr>
<td>RES0</td>
</tr>
</tbody>
</table>

**Accessing the ID_AA64MMFR1_EL1:**

ID_AA64MMFR1_EL1[31:0] can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x058</td>
</tr>
</tbody>
</table>

ID_AA64MMFR1_EL1[63:32] can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x05C</td>
</tr>
</tbody>
</table>
H9.2.48 ID_AA64PFR0_EL1, Processor Feature Register 0

The ID_AA64PFR0_EL1 characteristics are:

Purpose

Provides additional information about implemented processor features in AArch64.
This register is part of the Identification registers functional group.

Usage constraints

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

Configurations

ID_AA64PFR0_EL1 is architecturally mapped to AArch64 register ID_AA64PFR0_EL1.
ID_AA64PFR0_EL1 is in the Debug power domain.

Attributes

ID_AA64PFR0_EL1 is a 64-bit register.

The ID_AA64PFR0_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>28 27</th>
<th>24 23</th>
<th>20 19</th>
<th>16 15</th>
<th>12 11</th>
<th>8 7</th>
<th>4 3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>GIC</td>
<td>AdvSIMD</td>
<td>FP</td>
<td>EL3</td>
<td>EL2</td>
<td>EL1</td>
<td>EL0</td>
<td></td>
</tr>
</tbody>
</table>

Bits [63:28]

Reserved, RES0.

GIC, bits [27:24]

GIC system register interface. Permitted values are:

0000  No GIC system registers are supported.
0001  GICv3 system registers are supported.
All other values are reserved.

AdvSIMD, bits [23:20]

Advanced SIMD. Permitted values are:

0000  Advanced SIMD is implemented.
1111  Advanced SIMD is not implemented.
All other values are reserved.

FP, bits [19:16]

Floating-point. Permitted values are:

0000  Floating-point is implemented.
1111  Floating-point is not implemented.
All other values are reserved.
EL3, bits [15:12]
EL3 exception level handling. Permitted values are:
0000 EL3 is not implemented.
0001 EL3 can be executed in AArch64 state only.
0010 EL3 can be executed in either AArch64 or AArch32 state.
All other values are reserved.

EL2, bits [11:8]
EL2 exception level handling. Permitted values are:
0000 EL2 is not implemented.
0001 EL2 can be executed in AArch64 state only.
0010 EL2 can be executed in either AArch64 or AArch32 state.
All other values are reserved.

EL1, bits [7:4]
EL1 exception level handling. Permitted values are:
0000 EL1 is not implemented.
0001 EL1 can be executed in AArch64 state only.
0010 EL1 can be executed in either AArch64 or AArch32 state.
All other values are reserved.

EL0, bits [3:0]
EL0 exception level handling. Permitted values are:
0000 EL0 is not implemented.
0001 EL0 can be executed in AArch64 state only.
0010 EL0 can be executed in either AArch64 or AArch32 state.
All other values are reserved.

Accessing the ID_AA64PFR0_EL1:
ID_AA64PFR0_EL1[31:0] can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xD20</td>
</tr>
</tbody>
</table>

ID_AA64PFR0_EL1[63:32] can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0xD24</td>
</tr>
</tbody>
</table>
H9.2.49 ID_AA64PFR1_EL1, Processor Feature Register 1

The ID_AA64PFR1_EL1 characteristics are:

**Purpose**

Reserved for future expansion of information about implemented processor features in AArch64.
This register is part of the Identification registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

**Configurations**

ID_AA64PFR1_EL1 is architecturally mapped to AArch64 register ID_AA64PFR1_EL1.
ID_AA64PFR1_EL1 is in the Debug power domain.

**Attributes**

ID_AA64PFR1_EL1 is a 64-bit register.
The ID_AA64PFR1_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Component Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>Debug 0x040</td>
</tr>
</tbody>
</table>

**Accessing the ID_AA64PFR1_EL1:**

ID_AA64PFR1_EL1[31:0] can be accessed through the internal memory-mapped interface and the external debug interface:

**Component** | **Offset**
--- | ---
Debug | 0x040

ID_AA64PFR1_EL1[63:32] can be accessed through the internal memory-mapped interface and the external debug interface:

**Component** | **Offset**
--- | ---
Debug | 0x044
H9.2.50 MIDR_EL1, Main ID Register

The MIDR_EL1 characteristics are:

Purpose

Provides identification information for the processor, including an implementer code for the device and a device ID number.

This register is part of the Identification registers functional group.

Usage constraints

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

Configurations

MIDR_EL1 is architecturally mapped to AArch64 register MIDR_EL1.
MIDR_EL1 is architecturally mapped to AArch32 register MIDR.
MIDR_EL1 is in the Debug power domain.

Attributes

MIDR_EL1 is a 32-bit register.

The MIDR_EL1 bit assignments are:

```
+-----+-----+-----+-----+-----+-----+-----+-----+
| 31  | 24  | 23  | 20  | 19  | 16  | 15  | 4   | 3   | 0   |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| Implementer | Variant | PartNum | Revision |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
```

Architecture

Implementer, bits [31:24]

The Implementer code. This field must hold an implementer code that has been assigned by ARM. Assigned codes include the following:

<table>
<thead>
<tr>
<th>Hex representation</th>
<th>ASCII representation</th>
<th>Implementer</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x41</td>
<td>A</td>
<td>ARM Limited</td>
</tr>
<tr>
<td>0x42</td>
<td>B</td>
<td>Broadcom Corporation</td>
</tr>
<tr>
<td>0x43</td>
<td>C</td>
<td>Cavium Inc.</td>
</tr>
<tr>
<td>0x44</td>
<td>D</td>
<td>Digital Equipment Corporation</td>
</tr>
<tr>
<td>0x49</td>
<td>I</td>
<td>Infineon Technologies AG</td>
</tr>
<tr>
<td>0x40</td>
<td>M</td>
<td>Motorola or Freescale Semiconductor Inc.</td>
</tr>
<tr>
<td>0x4E</td>
<td>N</td>
<td>NVIDIA Corporation</td>
</tr>
<tr>
<td>0x50</td>
<td>P</td>
<td>Applied Micro Circuits Corporation</td>
</tr>
</tbody>
</table>
Variant, bits [23:20]

An IMPLEMENTATION DEFINED variant number. Typically, this field is used to distinguish between different product variants, or major revisions of a product.

Architecture, bits [19:16]

The permitted values of this field are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Architecture</th>
</tr>
</thead>
<tbody>
<tr>
<td>0001</td>
<td>ARMv4</td>
</tr>
<tr>
<td>0010</td>
<td>ARMv4T</td>
</tr>
<tr>
<td>0011</td>
<td>ARMv5 (obsolete)</td>
</tr>
<tr>
<td>0100</td>
<td>ARMv5T</td>
</tr>
<tr>
<td>0101</td>
<td>ARMv5TE</td>
</tr>
<tr>
<td>0110</td>
<td>ARMv5TEJ</td>
</tr>
<tr>
<td>0111</td>
<td>ARMv6</td>
</tr>
<tr>
<td>1111</td>
<td>Defined by CPUID scheme</td>
</tr>
</tbody>
</table>

All other values are reserved.

PartNum, bits [15:4]

An IMPLEMENTATION DEFINED primary part number for the device. On processors implemented by ARM, if the top four bits of the primary part number are 0x0 or 0x7, the variant and architecture are encoded differently.

Revision, bits [3:0]

An IMPLEMENTATION DEFINED revision number for the device.

### Accessing the MIDR_EL1:

MIDR_EL1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x000</td>
</tr>
</tbody>
</table>
OSLAR_EL1, OS Lock Access Register

The OSLAR_EL1 characteristics are:

Purpose

Used to lock or unlock the OS lock.
This register is part of the Debug registers functional group.

Usage constraints

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>WI</td>
<td>WO</td>
</tr>
</tbody>
</table>

Configurations

OSLAR_EL1 is architecturally mapped to AArch64 register OSLAR_EL1.
OSLAR_EL1 is architecturally mapped to AArch32 register DBGOSLAR.
OSLAR_EL1 is in the Core power domain.

Attributes

OSLAR_EL1 is a 32-bit register.
The OSLAR_EL1 bit assignments are:

```
  31  1  0
```

RES0

OSLK

Bits [31:1]

Reserved, RES0.

OSLK, bit [0]

On writes to OSLAR_EL1, bit[0] is copied to the OS lock.
Use EDPRSR.OSLK to check the current status of the lock.

Accessing the OSLAR_EL1:

OSLAR_EL1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debug</td>
<td>0x300</td>
</tr>
</tbody>
</table>
H9.3 Cross-Trigger Interface registers

This section lists the Cross-Trigger Interface registers that are accessible through the external debug interface.

H9.3.1 ASICCTL, CTI External Multiplexer Control register

The ASICCTL characteristics are:

**Purpose**

Provides a control for external multiplexing of additional triggers into the CTI.

This register is part of the Cross-Trigger Interface registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

ASICCTL is in the Debug power domain.

**Attributes**

ASICCTL is a 32-bit register.

The ASICCTL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved RES0</td>
</tr>
<tr>
<td>8</td>
<td>ASICCTL</td>
</tr>
</tbody>
</table>

**Accessing the ASICCTL:**

ASICCTL can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x144</td>
</tr>
</tbody>
</table>
H9.3.2  CTIAPPCLEAR, CTI Application Trigger Clear register

The CTIAPPCLEAR characteristics are:

**Purpose**

Clears bits of the Application Trigger register.
This register is part of the Cross-Trigger Interface registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>WO</td>
</tr>
</tbody>
</table>

**Configurations**

CTIAPPCLEAR is in the Debug power domain.

**Attributes**

CTIAPPCLEAR is a 32-bit register.

The CTIAPPCLEAR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>APPCLEAR&lt;x&gt;</td>
</tr>
</tbody>
</table>

**APPCLEAR<x>, bit [x] for x = 0 to (N - 1)**

Application trigger <x> disable.

N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Bits [31:N] are RAZ/WI.

Writing to this bit has the following effect:

0  No effect.
1  Clear corresponding bit in CTIAPPTRIG to 0 and clear the corresponding channel event.

If the ECT does not support multicycle channel events, use of CTIAPPCLEAR is deprecated and the debugger must only use CTIAPPULSE.

**Accessing the CTIAPPCLEAR:**

CTIAPPCLEAR can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x018</td>
</tr>
</tbody>
</table>
H9.3.3 CTIAPPULSE, CTI Application Pulse register

The CTIAPPULSE characteristics are:

**Purpose**

Causes event pulses to be generated on ECT channels.

This register is part of the Cross-Trigger Interface registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>WO</td>
</tr>
</tbody>
</table>

**Configurations**

CTIAPPULSE is in the Debug power domain.

**Attributes**

CTIAPPULSE is a 32-bit register.

The CTIAPPULSE bit assignments are:

31 0

| APPPULSE<x> |

**APPPULSE<x>, bit [x] for x = 0 to (N - 1)**

Generate event pulse on ECT channel <x>.

N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Bits [31:N] are RAZ/WI.

Writing to this bit has the following effect:

0  No effect.
1  Channel <x> event pulse generated for one clock period.

**Accessing the CTIAPPULSE:**

CTIAPPULSE can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x01C</td>
</tr>
</tbody>
</table>
H9.3.4 CTIAPPSET, CTI Application Trigger Set register

The CTIAPPSET characteristics are:

Purpose

Sets bits of the Application Trigger register.
This register is part of the Cross-Trigger Interface registers functional group.

Usage constraints

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

Configurations

CTIAPPSET is in the Debug power domain.

Attributes

CTIAPPSET is a 32-bit register.

The CTIAPPSET bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
</table>

APPSET<x>, bit [x] for x = 0 to (N - 1)

Application trigger <x> enable.
N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.
Bits [31:N] are RAZ/WI.
Possible values of this bit are:
0  Reading this means the application trigger is inactive. Writing this has no effect.
1  Reading this means the application trigger is active. Writing this sets the corresponding bit in CTIAPPPTRIG to 1 and generates a channel event.

If the ECT does not support multicycle channel events, use of CTIAPPSET is deprecated and the debugger must only use CTIAPPULSE.

On External debug reset, the field reset value is architecturally UNKNOWN.

Accessing the CTIAPPSET:

CTIAPPSET can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x014</td>
</tr>
</tbody>
</table>
H9.3.5  CTIAUTHSTATUS, CTI Authentication Status register

The CTIAUTHSTATUS characteristics are:

Purpose

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for CTI.

This register is part of the Cross-Trigger Interface registers functional group.

Usage constraints

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Configurations

CTIAUTHSTATUS is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance. ARM recommends that this register is implemented.

CTIAUTHSTATUS.{SNID,SID} are RAZ, because the CTI does not itself provide Secure authentication.

Attributes

CTIAUTHSTATUS is a 32-bit register.

The CTIAUTHSTATUS bit assignments are:

---

Bits [31:4]

Reserved, RES0.

NSNID, bits [3:2]

If EL3 is not implemented and the processor is Secure, holds the same value as DBGAUTHSTATUS_EL1.SNID.

Otherwise, holds the same value as DBGAUTHSTATUS_EL1.NSNID.

NSID, bits [1:0]

If EL3 is not implemented and the processor is Secure, holds the same value as DBGAUTHSTATUS_EL1.SID.

Otherwise, holds the same value as DBGAUTHSTATUS_EL1.NSID.
Accessing the CTIAUTHSTATUS:

CTIAUTHSTATUS can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFB8</td>
</tr>
</tbody>
</table>
H9.3.6 CTICHINSTATUS, CTI Channel In Status register

The CTICHINSTATUS characteristics are:

**Purpose**

Provides the raw status of the ECT channel inputs to the CTI.

This register is part of the Cross-Trigger Interface registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTICHINSTATUS is in the Debug power domain.

**Attributes**

CTICHINSTATUS is a 32-bit register.

The CTICHINSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHIN&lt;n&gt;</td>
<td></td>
</tr>
</tbody>
</table>

**CHIN<n>, bit [x] for x = 0 to (N - 1)**

Input channel <n> status.

N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Bits [31:N] are RAZ.

Possible values of this bit are:

- 0 Input channel <n> is inactive.
- 1 Input channel <n> is active.

**Accessing the CTICHINSTATUS:**

CTICHINSTATUS can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x138</td>
</tr>
</tbody>
</table>
**H9.3.7 CTICHOUTSTATUS, CTI Channel Out Status register**

The CTICHOUTSTATUS characteristics are:

**Purpose**

Provides the status of the ECT channel outputs from the CTI.

This register is part of the Cross-Trigger Interface registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTICHOUTSTATUS is in the Debug power domain.

**Attributes**

CTICHOUTSTATUS is a 32-bit register.

The CTICHOUTSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>CHOUT&lt;n&gt;</td>
</tr>
</tbody>
</table>

**CHOUT<n>, bit [x] for x = 0 to (N - 1)**

Output channel <n> status.

N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Bits [31:N] are RAZ.

Possible values of this bit are:

0  Output channel <n> is inactive.
1  Output channel <n> is active.

**Accessing the CTICHOUTSTATUS:**

CTICHOUTSTATUS can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x13C</td>
</tr>
</tbody>
</table>
H9.3.8 CTICIDR0, CTI Component Identification Register 0

The CTICIDR0 characteristics are:

**Purpose**

Provides information to identify a CTI component.

This register is part of the Cross-Trigger Interface registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTICIDR0 is in the Debug power domain.

CTICIDR0 is optional to implement in the external register interface.

This register is required for CoreSight compliance.

**Attributes**

CTICIDR0 is a 32-bit register.

The CTICIDR0 bit assignments are:

<table>
<thead>
<tr>
<th></th>
<th>Bits [31:8]</th>
<th>PRMBL_0, bits [7:0]</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>Reserved, RES0.</td>
<td>Preamble. Must read as 0x00.</td>
</tr>
</tbody>
</table>

**Accessing the CTICIDR0:**

CTICIDR0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFF0</td>
</tr>
</tbody>
</table>
H9.3.9 CTICIDR1, CTI Component Identification Register 1

The CTICIDR1 characteristics are:

**Purpose**

Provides information to identify a CTI component.
This register is part of the Cross-Trigger Interface registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTICIDR1 is in the Debug power domain.
CTICIDR1 is optional to implement in the external register interface.
This register is required for CoreSight compliance.

**Attributes**

CTICIDR1 is a 32-bit register.

The CTICIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>CLASS</td>
<td>PRMBL_1</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**CLASS, bits [7:4]**

Component class. Reads as 0x9, debug component.

**PRMBL_1, bits [3:0]**

Preamble. RAZ.

**Accessing the CTICIDR1:**

CTICIDR1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFFF4</td>
</tr>
</tbody>
</table>
H9.3.10  CTICIDR2, CTI Component Identification Register 2

The CTICIDR2 characteristics are:

**Purpose**

Provides information to identify a CTI component.

This register is part of the Cross-Trigger Interface registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTICIDR2 is in the Debug power domain.

CTICIDR2 is optional to implement in the external register interface.

This register is required for CoreSight compliance.

**Attributes**

CTICIDR2 is a 32-bit register.

The CTICIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>PRMBL_2</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_2, bits [7:0]**

Preamble. Must read as 0x05.

**Accessing the CTICIDR2:**

CTICIDR2 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFF8</td>
</tr>
</tbody>
</table>
H9.3.11 CTICIDR3, CTI Component Identification Register 3

The CTICIDR3 characteristics are:

Purpose

Provides information to identify a CTI component.
This register is part of the Cross-Trigger Interface registers functional group.

Usage constraints

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Configurations

CTICIDR3 is in the Debug power domain.
CTICIDR3 is optional to implement in the external register interface.
This register is required for CoreSight compliance.

Attributes

CTICIDR3 is a 32-bit register.

The CTICIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RES0</td>
<td>PRMBL_3</td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:8]

Reserved, RES0.

PRMBL_3, bits [7:0]

Preamble. Must read as 0xB1.

Accessing the CTICIDR3:

CTICIDR3 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFFC</td>
</tr>
</tbody>
</table>
H9.3.12 CTICLAIMCLR, CTI Claim Tag Clear register

The CTICLAIMCLR characteristics are:

Purpose

Used by software to read the values of the CLAIM bits, and to clear these bits to 0.

This register is part of the Cross-Trigger Interface registers functional group.

Usage constraints

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

Configurations

CTICLAIMCLR is in the Debug power domain.
CTICLAIMCLR is optional to implement in the external register interface.

Attributes

CTICLAIMCLR is a 32-bit register.

The CTICLAIMCLR bit assignments are:

CLAIM[x], bit [x], bits [31:0]

Clear CLAIM tag. If x is greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

Otherwise, reads return the value of CLAIM[x] and the behavior on writes is:

0  No action.
1  Indirectly clear CLAIM[x] to 0.

A single write to CTICLAIMCLR can clear multiple tags to 0.

Accessing the CTICLAIMCLR:

CTICLAIMCLR can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFA4</td>
</tr>
</tbody>
</table>
H9.3.13 CTICLAIMSET, CTI Claim Tag Set register

The CTICLAIMSET characteristics are:

Purpose

Used by software to set CLAIM bits to 1.

This register is part of the Cross-Trigger Interface registers functional group.

Usage constraints

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

Configurations

CTICLAIMSET is in the Debug power domain.

CTICLAIMSET is optional to implement in the external register interface.

Attributes

CTICLAIMSET is a 32-bit register.

The CTICLAIMSET bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLAIM[x], bit [x]</td>
<td></td>
</tr>
</tbody>
</table>

CLAIM[x], bit [x], bits [31:0]

CLAIM tag set bit. If x is greater than or equal to the IMPLEMENTATION DEFINED number of CLAIM tags, this bit is RAZ/SBZ. Software can rely on these bits reading as zero, and must use a should-be-zero policy on writes. Implementations must ignore writes.

Otherwise, the bit is RAO and the behavior on writes is:

0 No action.

1 Indirectly set CLAIM[x] tag to 1.

A single write to CTICLAIMSET can set multiple tags to 1.

Accessing the CTICLAIMSET:

CTICLAIMSET can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFA0</td>
</tr>
</tbody>
</table>
H9.3.14 CTICONTROL, CTI Control register

The CTICONTROL characteristics are:

Purpose

Controls whether the CTI is enabled.
This register is part of the Cross-Trigger Interface registers functional group.

Usage constraints

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

Configurations

CTICONTROL is in the Debug power domain.

Attributes

CTICONTROL is a 32-bit register.

The CTICONTROL bit assignments are:

<table>
<thead>
<tr>
<th>Bit assignments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bits [31:1]</td>
</tr>
<tr>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>

GLBEN, bit [0]

Enables or disables the CTI mapping functions. Possible values of this field are:

0: CTI mapping functions disabled.
1: CTI mapping functions enabled.

When the mapping functions are disabled, no new events are signaled on either output triggers or output channels. If a previously asserted output trigger has not been acknowledged, it remains asserted after the mapping functions are disabled. All output triggers are disabled by CTI reset.

On External debug reset, the field resets to 0.

Accessing the CTICONTROL:

CTICONTROL can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x000</td>
</tr>
</tbody>
</table>
H9.3.15 CTIDEEVAFF0, CTI Device Affinity register 0

The CTIDEEVAFF0 characteristics are:

**Purpose**

Copy of the low half of the processor MPIDR_EL1 register that allows a debugger to determine which processor in a multiprocessor system the CTI component relates to.

This register is part of the Cross-Trigger Interface registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTIDEEVAFF0 is in the Debug power domain.

CTIDEEVAFF0 is optional to implement in the external register interface.

**Attributes**

CTIDEEVAFF0 is a 32-bit register.

The CTIDEEVAFF0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
</table>

MPIDR_EL1 low half

**Bits [31:0]**

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented exception level.

**Accessing the CTIDEEVAFF0:**

CTIDEEVAFF0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFA8</td>
</tr>
</tbody>
</table>
H9.3.16 CTIDEVAFF1, CTI Device Affinity register 1

The CTIDEVAFF1 characteristics are:

**Purpose**

Copy of the high half of the processor MPIDR_EL1 register that allows a debugger to determine which processor in a multiprocessor system the CTI component relates to.

This register is part of the Cross-Trigger Interface registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTIDEVAFF1 is in the Debug power domain.

CTIDEVAFF1 is optional to implement in the external register interface.

**Attributes**

CTIDEVAFF1 is a 32-bit register.

The CTIDEVAFF1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>MPIDR_EL1 high half</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented exception level.

**Accessing the CTIDEVAFF1:**

CTIDEVAFF1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>$0xFAC</td>
</tr>
</tbody>
</table>

H9.3.17 CTIDEVARCH, CTI Device Architecture register

The CTIDEVARCH characteristics are:

**Purpose**

Identifies the programmers' model architecture of the CTI component.

This register is part of the Cross-Trigger Interface registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTIDEVARCH is in the Debug power domain.

CTIDEVARCH is optional to implement in the external register interface.

**Attributes**

CTIDEVARCH is a 32-bit register.

The CTIDEVARCH bit assignments are:

```
31 21 20 19 16 15 0
ARCHITECT  REVISION  ARCHID
PRESEN     
```

**ARCHITECT, bits [31:21]**

Defines the architecture of the component. For CTI, this is ARM Limited.

Bits [31:28] are the JEP 106 continuation code, 0x4.

Bits [27:21] are the JEP 106 ID code, 0x3B.

**PRESENT, bit [20]**

When set to 1, indicates that the DEVARCH is present.

This field is 1 in v8-A.

**REVISION, bits [19:16]**

Defines the architecture revision. For architectures defined by ARM this is the minor revision.

For CTI, the revision defined by v8-A is 0x0.

All other values are reserved.

**ARCHID, bits [15:0]**

Defines this part to be a v8-A debug component. For architectures defined by ARM this is further subdivided.

For CTI:

- Bits [15:12] are the architecture version, 0x1.
- Bits [11:0] are the architecture part number, 0xA14.

This corresponds to CTI architecture version CTIv2.
Accessing the CTIDEVARCH:

CTIDEVARCH can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFBC</td>
</tr>
</tbody>
</table>
H9.3.18 CTIDEVID, CTI Device ID register 0

The CTIDEVID characteristics are:

**Purpose**

Describes the CTI component to the debugger.

This register is part of the Cross-Trigger Interface registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTIDEVID is in the Debug power domain.

**Attributes**

CTIDEVID is a 32-bit register.

The CTIDEVID bit assignments are:

```
31  26  25  24  23  22  21  16  15  14  13  8  7  5  4  0
  RES0  NUMCHAN  NUMTRIG  RES0  EXTMUXNUM
  INOUT  RES0
```

**Bits [31:26]**

Reserved, RES0.

**INOUT, bits [25:24]**

Input/output options. Indicates presence of the input gate. If the CTM is not implemented, this field is RAZ.

- 00  **CTIGATE** does not mask propagation of input events from external channels.
- 01  **CTIGATE** masks propagation of input events from external channels.

All other values are reserved.

**Bits [23:22]**

Reserved, RES0.

**NUMCHAN, bits [21:16]**

Number of ECT channels implemented. IMPLEMENTATION DEFINED. For v8-A, valid values are:

- 000011  3 channels (0-2) implemented.
- 000100  4 channels (0-3) implemented.
- 000101  5 channels (0-4) implemented.
- 000110  6 channels (0-5) implemented.

and so on up to 0b100000, 32 channels (0-31) implemented.

All other values are reserved.
**Bits [15:14]**

Reserved, RES0.

**NUMTRIG, bits [13:8]**

Number of triggers implemented. IMPLEMENTATION DEFINED. This is one more than the index of the largest trigger, rather than the actual number of triggers.

For v8-A, valid values are:

- 000011 Up to 3 triggers (0-2) implemented.
- 001000 Up to 8 triggers (0-7) implemented.
- 001001 Up to 9 triggers (0-8) implemented.
- 001010 Up to 10 triggers (0-9) implemented.
- and so on up to 0b100000, 32 triggers (0-31) implemented.

All other values are reserved. If the Trace Extension is implemented, this field must be at least 001000. There is no guarantee that any of the implemented triggers, including the highest numbered, are connected to any components.

**Bits [7:5]**

Reserved, RES0.

**EXTMUXNUM, bits [4:0]**

Maximum number of external triggers available for multiplexing into the CTI. This relates only to additional external triggers outside those defined for v8-A.

**Accessing the CTIDEVID:**

CTIDEVID can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFC8</td>
</tr>
</tbody>
</table>
H9.3.19  CTIDEVID1, CTI Device ID register 1

The CTIDEVID1 characteristics are:

Purpose

Reserved for future information about the CTI component to the debugger.
This register is part of the Cross-Trigger Interface registers functional group.

Usage constraints

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Configurations

CTIDEVID1 is in the Debug power domain.

Attributes

CTIDEVID1 is a 32-bit register.

The CTIDEVID1 bit assignments are:

| Bits [31:0] | RES0 |

Bits [31:0]

Reserved, RES0.

Accessing the CTIDEVID1:

CTIDEVID1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFC4</td>
</tr>
</tbody>
</table>
H9.3.20  CTIDEVID2, CTI Device ID register 2

The CTIDEVID2 characteristics are:

**Purpose**

Reserved for future information about the CTI component to the debugger.
This register is part of the Cross-Trigger Interface registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTIDEVID2 is in the Debug power domain.

**Attributes**

CTIDEVID2 is a 32-bit register.

The CTIDEVID2 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RES0</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Reserved, RES0.

**Accessing the CTIDEVID2:**

CTIDEVID2 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xF0</td>
</tr>
</tbody>
</table>
H9.3.21 CTIDEVTYPE, CTI Device Type register

The CTIDEVTYPE characteristics are:

Purpose

Indicates to a debugger that this component is part of a processor's cross-trigger interface.
This register is part of the Cross-Trigger Interface registers functional group.

Usage constraints

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Configurations

CTIDEVTYPE is in the Debug power domain.
CTIDEVTYPE is optional to implement in the external register interface.

Attributes

CTIDEVTYPE is a 32-bit register.

The CTIDEVTYPE bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RES0</td>
<td>SUB</td>
<td>MAJOR</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:8]

Reserved, RES0.

SUB, bits [7:4]

Subtype. Must read as 0x1 to indicate this is a processor component.

MAJOR, bits [3:0]

Major type. Must read as 0x4 to indicate this is a cross-trigger component.

Accessing the CTIDEVTYPE:

CTIDEVTYPE can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFCC</td>
</tr>
</tbody>
</table>
H9.3.22 CTIGATE, CTI Channel Gate Enable register

The CTIGATE characteristics are:

**Purpose**

Determines whether events on channels propagate through the CTM to other ECT components, or from the CTM into the CTI.

This register is part of the Cross-Trigger Interface registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

CTIGATE is in the Debug power domain.

**Attributes**

CTIGATE is a 32-bit register.

The CTIGATE bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>GATE&lt;0&gt;</td>
<td></td>
</tr>
</tbody>
</table>

**GATE<0>, bit [x] for x = 0 to (N - 1)**

Channel <x> gate enable.

N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Bits [31:N] are RAZ/WI.

Possible values of this bit are:

0 Disable output and, if CTIDEVID.INOUT == 0b01, input channel <x> propagation.
1 Enable output and, if CTIDEVID.INOUT == 0b01, input channel <x> propagation.

On External debug reset, the field reset value is architecturally UNKNOWN.

**Accessing the CTIGATE:**

CTIGATE can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x140</td>
</tr>
</tbody>
</table>
H9.3.23  CTIINEN\(<n>\), CTI Input Trigger to Output Channel Enable registers, n = 0 - 31

The CTIINEN\(<n>\) characteristics are:

**Purpose**
Enables the signaling of an event on output channels when input trigger event \(n\) is received by the CTI.
This register is part of the Cross-Trigger Interface registers functional group.

**Usage constraints**
This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**
CTIINEN\(<n>\) is in the Debug power domain.

**Attributes**
CTIINEN\(<n>\) is a 32-bit register.
The CTIINEN\(<n>\) bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>INEN(&lt;x&gt;)</td>
<td></td>
</tr>
</tbody>
</table>

INEN\(<x>\), bit \([x]\) for \(x = 0\) to \((N - 1)\)
Input trigger \(<n>\) to output channel \(<x>\) enable.
\(N\) is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.
Bits \([31:N]\) are RAZ/WI.
Possible values of this bit are:
0  Input trigger \(<n>\) will not generate an event on output channel \(<x>\).
1  Input trigger \(<n>\) will generate an event on output channel \(<x>\).
On External debug reset, the field reset value is architecturally UNKNOWN.

**Accessing the CTIINEN\(<n>\):**
CTIINEN\(<n>\) can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x020 + 4n</td>
</tr>
</tbody>
</table>
H9.3.24 CTIINTACK, CTI Output Trigger Acknowledge register

The CTIINTACK characteristics are:

**Purpose**

Can be used to create soft acknowledges for output triggers.

This register is part of the Cross-Trigger Interface registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>WO</td>
</tr>
</tbody>
</table>

**Configurations**

CTIINTACK is in the Debug power domain.

**Attributes**

CTIINTACK is a 32-bit register.

The CTIINTACK bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACK&lt;(n)&gt;</td>
<td></td>
</tr>
</tbody>
</table>

**ACK<\(n\)>**, bit \([x]\) for \(x = 0 \text{ to } (N - 1)\)

Acknowledge for output trigger \(<n>\).

\(N\) is the number of CTI triggers implemented as defined by the CTIDEVID.NUMTRIG field. Bits \([31:N]\) are RAZ/WI.

If any of the following is true, writes to ACK<\(n\)> are ignored:

- \(n \geq \text{CTIDEVID.NUMTRIG}\), the number of implemented triggers.
- Output trigger \(n\) is not active.
- The channel mapping function output, as controlled by CTIOUTEN<\(n\)>, is still active.

Otherwise, if any of the following are true, it is IMPLEMENTATION DEFINED whether writes to ACK<\(n\)> are ignored:

- Output trigger \(n\) is not implemented.
- Output trigger \(n\) is not connected.
- Output trigger \(n\) is self-acknowledging and does not require software acknowledge.

Otherwise, the behavior on writes to ACK<\(n\)> is as follows:

- 0  No effect
- 1  Deactivate the trigger.
Accessing the CTINTACK:

CTINTACK can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x010</td>
</tr>
</tbody>
</table>
H9.3.25  CTIITCTRL, CTI Integration mode Control register

The CTIITCTRL characteristics are:

Purpose

Enables the CTI to switch from its default mode into integration mode, where test software can control directly the inputs and outputs of the processor, for integration testing or topology detection.

This register is part of the Cross-Trigger Interface registers functional group.

Usage constraints

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>RW</th>
</tr>
</thead>
</table>

Configurations

CTIITCTRL is in the Debug power domain.

CTIITCTRL is optional to implement in the external register interface.

Attributes

CTIITCTRL is a 32-bit register.

The CTIITCTRL bit assignments are:

31 1 0

RES0 IME

Bits [31:1]

Reserved, RES0.

IME, bit [0]

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

0 Normal operation.

1 Integration mode enabled.

On IMPLEMENTATION DEFINED reset, the field resets to 0.

Accessing the CTIITCTRL:

CTIITCTRL can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xF00</td>
</tr>
</tbody>
</table>
H9.3.26 CTILAR, CTI Lock Access Register

The CTILAR characteristics are:

Purpose

Allows or disallows access to the CTI registers through a memory-mapped interface.

This register is part of the Cross-Trigger Interface registers functional group.

Usage constraints

This register is accessible as shown below:

| Default | WO |

Configurations

CTILAR is in the Debug power domain.

If optional memory-mapped access to the external debug interface is supported then an optional Software lock can be implemented as part of CoreSight compliance.

CTILAR ignores writes if the Software lock is not implemented and ignores writes for other accesses to the external debug interface.

The Software lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

Software uses CTILAR to set or clear the lock, and CTILSR to check the current status of the lock.

Attributes

CTILAR is a 32-bit register.

The CTILAR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>KEY</td>
<td></td>
</tr>
</tbody>
</table>

KEY, bits [31:0]

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Accessing the CTILAR:

CTILAR can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFB0</td>
</tr>
</tbody>
</table>
H9.3.27 CTILSR, CTI Lock Status Register

The CTILSR characteristics are:

**Purpose**

Indicates the current status of the software lock for CTI registers.
This register is part of the Cross-Trigger Interface registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

**Configurations**

CTILSR is in the Debug power domain.

If OPTIONAL memory-mapped access to the external debug interface is supported then an OPTIONAL Software lock can be implemented as part of CoreSight compliance.

CTILSR is RAZ if the Software lock is not implemented and is RAZ for other accesses to the external debug interface.

The Software lock provides a lock to prevent memory-mapped writes to the Cross-Trigger Interface registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Cross-Trigger Interface registers. It does not, and cannot, prevent all accidental or malicious damage.

Software uses CTILAR to set or clear the lock, and CTILSR to check the current status of the lock.

**Attributes**

CTILSR is a 32-bit register.

The CTILSR bit assignments are:

<table>
<thead>
<tr>
<th></th>
<th>31</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**nTT, bit [2]**

Not thirty-two bit access required. RAZ.

**SLK, bit [1]**

Software lock status for this component. For an access to LSR that is not a memory-mapped access, or when the software lock is not implemented, this field is RES0.

For memory-mapped accesses when the software lock is implemented, possible values of this field are:

| 0 | Lock clear. Writes are permitted to this component's registers. |
Lock set. Writes to this component's registers are ignored, and reads have no side effects.

On External debug reset, the field resets to 1.

**SLI, bit [0]**

Software lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

- 0: Software lock not implemented or not memory-mapped access.
- 1: Software lock implemented and memory-mapped access.

**Accessing the CTILSR:**

CTILSR can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFB4</td>
</tr>
</tbody>
</table>
H9.3.28  CTIOUTEN<n>, CTI Input Channel to Output Trigger Enable registers, n = 0 - 31

The CTIOUTEN<n> characteristics are:

**Purpose**

Defines which input channels generate output trigger n.

This register is part of the Cross-Trigger Interface registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

CTIOUTEN<n> is in the Debug power domain.

**Attributes**

CTIOUTEN<n> is a 32-bit register.

The CTIOUTEN<n> bit assignments are:

```
<table>
<thead>
<tr>
<th>31</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
</tr>
</tbody>
</table>

```

**OUTEN<x>, bit [x] for x = 0 to (N - 1)**

Input channel <x> to output trigger <n> enable.

N is the number of ECT channels implemented as defined by the CTIDEVID.NUMCHAN field.

Bits [31:N] are RAZ/WI.

Possible values of this bit are:

0  An event on input channel <x> will not cause output trigger <n> to be asserted.
1  An event on input channel <x> will cause output trigger <n> to be asserted.

On External debug reset, the field reset value is architecturally UNKNOWN.

**Accessing the CTIOUTEN<n>:**

CTIOUTEN<n> can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x0A0 + 4n</td>
</tr>
</tbody>
</table>
H9.3.29 CTIPIDR0, CTI Peripheral Identification Register 0

The CTIPIDR0 characteristics are:

**Purpose**

Provides information to identify a CTI component.
This register is part of the Cross-Trigger Interface registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTIPIDR0 is in the Debug power domain.
CTIPIDR0 is optional to implement in the external register interface.
This register is required for CoreSight compliance.

**Attributes**

CTIPIDR0 is a 32-bit register.
The CTIPIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>PART_0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PART_0, bits [7:0]**

Part number, least significant byte.

**Accessing the CTIPIDR0:**

CTIPIDR0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFE0</td>
</tr>
</tbody>
</table>
H9.3.30 CTIPIDR1, CTI Peripheral Identification Register 1

The CTIPIDR1 characteristics are:

**Purpose**

Provides information to identify a CTI component.

This register is part of the Cross-Trigger Interface registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTIPIDR1 is in the Debug power domain.

CTIPIDR1 is optional to implement in the external register interface.

This register is required for CoreSight compliance.

**Attributes**

CTIPIDR1 is a 32-bit register.

The CTIPIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>8</td>
<td>DES_0, bits [7:4]</td>
</tr>
<tr>
<td>4</td>
<td>PART_1, bits [3:0]</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**DES_0, bits [7:4]**

Designer, least significant nibble of JEP106 ID code. For ARM Limited, this field is 0b1011.

**PART_1, bits [3:0]**

Part number, most significant nibble.

**Accessing the CTIPIDR1:**

CTIPIDR1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFE4</td>
</tr>
</tbody>
</table>
H9.3.31  CTIPIDR2, CTI Peripheral Identification Register 2

The CTIPIDR2 characteristics are:

Purpose

Provides information to identify a CTI component.
This register is part of the Cross-Trigger Interface registers functional group.

Usage constraints

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Configurations

CTIPIDR2 is in the Debug power domain.
CTIPIDR2 is optional to implement in the external register interface.
This register is required for CoreSight compliance.

Attributes

CTIPIDR2 is a 32-bit register.

The CTIPIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>REVISION</td>
<td>DES_1</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:8]

Reserved, RES0.

REVISION, bits [7:4]

Part major revision. Parts can also use this field to extend Part number to 16-bits.

JEDEC, bit [3]

RAO. Indicates a JEP106 identity code is used.

DES_1, bits [2:0]

Designer, most significant bits of JEP106 ID code. For ARM Limited, this field is 0b011.

Accessing the CTIPIDR2:

CTIPIDR2 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFE8</td>
</tr>
</tbody>
</table>
H9.3.32  CTIPIDR3, CTI Peripheral Identification Register 3

The CTIPIDR3 characteristics are:

**Purpose**

Provides information to identify a CTI component.

This register is part of the Cross-Trigger Interface registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTIPIDR3 is in the Debug power domain.

CTIPIDR3 is optional to implement in the external register interface.

This register is required for CoreSight compliance.

**Attributes**

CTIPIDR3 is a 32-bit register.

The CTIPIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>RES0</td>
</tr>
<tr>
<td>8</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>REVAND</td>
</tr>
<tr>
<td>7</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>CMOD</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**REVAND, bits [7:4]**

Part minor revision. Parts using CTIPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

**CMOD, bits [3:0]**

Customer modified. Indicates someone other than the Designer has modified the component.

**Accessing the CTIPIDR3:**

CTIPIDR3 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFEC</td>
</tr>
</tbody>
</table>
H9.3.33 CTIPIDR4, CTI Peripheral Identification Register 4

The CTIPIDR4 characteristics are:

**Purpose**

Provides information to identify a CTI component.

This register is part of the Cross-Trigger Interface registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTIPIDR4 is in the Debug power domain.

CTIPIDR4 is optional to implement in the external register interface.

This register is required for CoreSight compliance.

**Attributes**

CTIPIDR4 is a 32-bit register.

The CTIPIDR4 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>SIZE</td>
<td>DES_2</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SIZE, bits [7:4]**

Size of the component. RAZ. Log₂ of the number of 4KB pages from the start of the component to the end of the component ID registers.

**DES_2, bits [3:0]**

Designer, JEP106 continuation code, least significant nibble. For ARM Limited, this field is 0b0100.

**Accessing the CTIPIDR4:**

CTIPIDR4 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0xFD0</td>
</tr>
</tbody>
</table>
CTITERGINSTATUS, CTI Trigger In Status register

The CTITERGINSTATUS characteristics are:

Purpose

Provides the status of the trigger inputs.

This register is part of the Cross-Trigger Interface registers functional group.

Usage constraints

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Configurations

CTITERGINSTATUS is in the Debug power domain.

Attributes

CTITERGINSTATUS is a 32-bit register.

The CTITERGINSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRIN&lt;n&gt;</td>
<td>0</td>
<td>Input trigger n is inactive.</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Input trigger n is active.</td>
</tr>
</tbody>
</table>

Accessing the CTITERGINSTATUS:

CTITERGINSTATUS can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x130</td>
</tr>
</tbody>
</table>
H9.3.35 CTITRIGOUTSTATUS, CTI Trigger Out Status register

The CTITRIGOUTSTATUS characteristics are:

**Purpose**

Provides the status of the trigger outputs.

This register is part of the Cross-Trigger Interface registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

CTITRIGOUTSTATUS is in the Debug power domain.

**Attributes**

CTITRIGOUTSTATUS is a 32-bit register.

The CTITRIGOUTSTATUS bit assignments are:

<table>
<thead>
<tr>
<th>Bit Assignment</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>0</td>
</tr>
<tr>
<td>30:32</td>
<td>TROUT&lt;n&gt;</td>
</tr>
<tr>
<td>31:N</td>
<td>RAZ</td>
</tr>
</tbody>
</table>

TROUT<n>, bit [x] for x = 0 to (N - 1)

Trigger output <n> status.

N is the number of CTI triggers implemented as defined by the CTIDEVID.NUMTRIG field.

Bits [31:N] are RAZ.

If output trigger <n> is implemented and connected, possible values of this bit are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Output trigger n is inactive.</td>
</tr>
<tr>
<td>1</td>
<td>Output trigger n is active.</td>
</tr>
</tbody>
</table>

Otherwise it is IMPLEMENTATION DEFINED whether TROUT<n> is RAZ or behaves as above.

**Accessing the CTITRIGOUTSTATUS:**

CTITRIGOUTSTATUS can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTI</td>
<td>0x134</td>
</tr>
</tbody>
</table>
Part I
Memory-mapped Components of the ARMv8 Architecture
Chapter I1
Memory-Mapped System Register Descriptions

This chapter describes the memory-mapped system control registers.

It contains the following items:
• Introduction on page I1-4598.
• Performance Monitors registers on page I1-4599.
• Generic Timer registers on page I1-4647.
I1.1 Introduction

The following sections describe the memory-mapped system control registers:

- *Performance Monitors registers* on page I1-4599.
- *Generic Timer registers* on page I1-4647.
I1.2 Performance Monitors registers

This section describes the Performance Monitoring registers.

I1.2.1 PMAUTHSTATUS, Performance Monitors Authentication Status register

The PMAUTHSTATUS characteristics are:

**Purpose**

Provides information about the state of the IMPLEMENTATION DEFINED authentication interface for Performance Monitors.

This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

PMAUTHSTATUS is in the Debug power domain.

This register is OPTIONAL, and is required for CoreSight compliance. ARM recommends that this register is implemented.

**Attributes**

PMAUTHSTATUS is a 32-bit register.

The PMAUTHSTATUS bit assignments are:

```
+-----------------+-----------------+
| Bits [1:0]      | Bits [9:0]      |
+-----------------+-----------------+
| RES0            | SNID            |
| RES0            | NSNID           |
+-----------------+-----------------+
```

**Bits [31:8]**

Reserved, RES0.

**SNID, bits [7:6]**

Holds the same value as DBGAUTHSTATUS_EL1.SNID.

**Bits [5:4]**

Reserved, RES0.

**NSNID, bits [3:2]**

Holds the same value as DBGAUTHSTATUS_EL1.NSNID.

**Bits [1:0]**

Reserved, RES0.
Accessing the PMAUTHSTATUS:

PMAUTHSTATUS can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xF88</td>
</tr>
</tbody>
</table>
11.2.2 PMCCFILTR_EL0, Performance Monitors Cycle Counter Filter Register

The PMCCFILTR_EL0 characteristics are:

**Purpose**

Determines the modes in which the Cycle Counter, PMCCNTR_EL0, increments.
This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Off DLK OSLK EPMAD SLK Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error Error Error Error RO RW</td>
</tr>
</tbody>
</table>

**Configurations**

PMCCFILTR_EL0 is architecturally mapped to AArch64 register PMCCFILTR_EL0.
PMCCFILTR_EL0 is architecturally mapped to AArch32 register PMCCFILTR.
PMCCFILTR_EL0 is in the Core power domain.

**Attributes**

PMCCFILTR_EL0 is a 32-bit register.

The PMCCFILTR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31 30 29 28 27 26 25</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>P U M</td>
<td>RES0</td>
</tr>
</tbody>
</table>

**P, bit [31]**

EL1 modes filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the NSK bit. The possible values of this bit are:
- 0: Count cycles in EL1.
- 1: Do not count cycles in EL1.

**U, bit [30]**

EL0 filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the NSU bit. The possible values of this bit are:
- 0: Count cycles in EL0.
- 1: Do not count cycles in EL0.

**NSK, bit [29]**

Non-secure kernel modes filtering bit. Controls counting in Non-secure EL1. If EL3 is not implemented, this bit is RES0.
If the value of this bit is equal to the value of P, cycles in Non-secure EL1 are counted.
Otherwise, cycles in Non-secure EL1 are not counted.
NSU, bit [28]

Non-secure user modes filtering bit. Controls counting in Non-secure EL0. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of U, cycles in Non-secure EL0 are counted. Otherwise, cycles in Non-secure EL0 are not counted.

NSH, bit [27]

Non-secure Hyp modes filtering bit. Controls counting in Non-secure EL2. If EL2 is not implemented, this bit is RES0.

0 Do not count cycles in EL2.
1 Count cycles in EL2.

M, bit [26]

Secure EL3 filtering bit. Most applications can ignore this bit and set the value to zero. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, cycles in Secure EL3 are counted. Otherwise, cycles in Secure EL3 are not counted.

Bits [25:0]

Reserved, RES0.

Accessing the PMCCFILTR_EL0:

PMCCFILTR_EL0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x47C</td>
</tr>
</tbody>
</table>
11.2.3 PMCCNTR_EL0, Performance Monitors Cycle Counter

The PMCCNTR_EL0 characteristics are:

Purpose

Holds the value of the processor Cycle Counter, CCNT, that counts processor clock cycles.
This register is part of the Performance Monitors registers functional group.

Usage constraints

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

Configurations

PMCCNTR_EL0 is architecturally mapped to AArch64 register PMCCNTR_EL0.
PMCCNTR_EL0 is architecturally mapped to AArch32 register PMCCNTR.
PMCCNTR_EL0 is in the Core power domain.

Attributes

PMCCNTR_EL0 is a 64-bit register.
The PMCCNTR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>32</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>CCNT</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

CCNT, bits [63:0]

Cycle count. Depending on the values of PMCR_EL0.{LC,D}, the cycle count increments in one of the following ways:
• Every processor clock cycle.
• Every 64th processor clock cycle.
The cycle count can be reset to zero by writing 1 to PMCR_EL0.C.

Accessing the PMCCNTR_EL0:

PMCCNTR_EL0[31:0] can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x8F8</td>
</tr>
</tbody>
</table>

PMCCNTR_EL0[63:32] can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x8FC</td>
</tr>
</tbody>
</table>
I1.2.4 PMCEID0_EL0, Performance Monitors Common Event Identification register 0

The PMCEID0_EL0 characteristics are:

**Purpose**

Defines which common architectural and common microarchitectural feature events are implemented. If a particular bit is set to 1, then the event for that bit is implemented.

This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

PMCEID0_EL0 is architecturally mapped to AArch64 register PMCEID0_EL0.

PMCEID0_EL0 is architecturally mapped to AArch32 register PMCEID0.

PMCEID0_EL0 is in the Core power domain.

**Attributes**

PMCEID0_EL0 is a 32-bit register.

The PMCEID0_EL0 bit assignments are:

31 0

<table>
<thead>
<tr>
<th>CE[31:0]</th>
</tr>
</thead>
</table>

**CE[31:0], bits [31:0]**

Common architectural and microarchitectural feature events that can be counted by the PMU event counters.

For each bit described in the following table, the event is implemented if the bit is set to 1, or not implemented if the bit is set to 0.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Event number</th>
<th>Event mnemonic</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>0x01F</td>
<td>L1D_CACHE_ALLOCATE</td>
</tr>
<tr>
<td>30</td>
<td>0x01E</td>
<td>CHAIN</td>
</tr>
<tr>
<td>29</td>

<td>0x018</td>
<td>L2D_CACHE_WB</td>
</tr>
<tr>
<td>23</td>
<td>0x017</td>
<td>L2D_CACHE_REFILL</td>
</tr>
</tbody>
</table>
### Accessing the PMCEID0_EL0:

PMCEID0_EL0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE20</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Bit</th>
<th>Event number</th>
<th>Event mnemonic</th>
</tr>
</thead>
<tbody>
<tr>
<td>22</td>

</tbody>
</table>
I1.2.5 PMCEID1_EL0, Performance Monitors Common Event Identification register 1

The PMCEID1_EL0 characteristics are:

**Purpose**

Reserved for future indication of which common architectural and common microarchitectural feature events are implemented.

This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

PMCEID1_EL0 is architecturally mapped to AArch64 register PMCEID1_EL0.
PMCEID1_EL0 is architecturally mapped to AArch32 register PMCEID1.
PMCEID1_EL0 is in the Core power domain.

**Attributes**

PMCEID1_EL0 is a 32-bit register.

The PMCEID1_EL0 bit assignments are:

31 1 0

RES0

CE[32]

**Bits [31:1]**

Reserved, RES0.

**CE[32], bit [0]**

Common architectural and microarchitectural feature events that can be counted by the PMU event counters.

For the bit described in the following table, the event is implemented if the bit is set to 1, or not implemented if the bit is set to 0.

<table>
<thead>
<tr>
<th>Bit</th>
<th>Event number</th>
<th>Event mnemonic</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0x820</td>
<td>L2D_CACHE_ALLOCATE</td>
</tr>
</tbody>
</table>
Accessing the PMCEID1_EL0:

PMCEID1_EL0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE24</td>
</tr>
</tbody>
</table>
I1.2.6 PMCFGR, Performance Monitors Configuration Register

The PMCFGR characteristics are:

**Purpose**

Contains PMU-specific configuration data.

This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

PMCFGR is in the Core power domain.

**Attributes**

PMCFGR is a 32-bit register.

The PMCFGR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>19</td>
<td>UEN, bit [19] User-mode Enable Register supported. PMUSERENR_EL0 is not visible in the external debug interface, so this bit is RES0.</td>
</tr>
<tr>
<td>18</td>
<td>WT, bit [18] This feature is not supported, so this bit is RES0.</td>
</tr>
<tr>
<td>17</td>
<td>NA, bit [17] This feature is not supported, so this bit is RES0.</td>
</tr>
<tr>
<td>16</td>
<td>EX, bit [16] Export supported. Value is IMPLEMENTATION DEFINED. 0 PMCR_EL0.X is RES0. 1 PMCR_EL0.X is read/write.</td>
</tr>
<tr>
<td>15</td>
<td>CCD, bit [15] Cycle counter has prescale. This is RES1 if AArch32 is supported at any EL, and RES0 otherwise. 0 PMCR_EL0.D is RES0.</td>
</tr>
</tbody>
</table>
PMCR_EL0.D is read/write.

CC, bit [14]
Dedicated cycle counter (counter 31) supported. This bit is RES1.

SIZE, bits [13:8]
Size of counters. This field determines the spacing of counters in the memory-map.
In v8-A the counters are at doubleword-aligned addresses, and the largest counter is 64-bits, so this field is 0b111111.

N, bits [7:0]
Number of counters implemented in addition to the cycle counter, PMCCNTR_EL0. The maximum number of event counters is 31, so bits[7:5] are always RES0.
00000000 Only PMCCNTR_EL0 implemented.
00000001 PMCCNTR_EL0 plus one event counter implemented.
and so on up to 0b00011111, which indicates PMCCNTR_EL0 and 31 event counters implemented.

Accessing the PMCFGR:
PMCFGR can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE00</td>
</tr>
</tbody>
</table>
### 11.2.7 PMCIDR0, Performance Monitors Component Identification Register 0

The PMCIDR0 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component. This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

PMCIDR0 is in the Debug power domain.
PMCIDR0 is optional to implement in the external register interface.
This register is required for CoreSight compliance.

**Attributes**

PMCIDR0 is a 32-bit register.

The PMCIDR0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>PRMBL_0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_0, bits [7:0]**

Preamble. Must read as 0x0D.

**Accessing the PMCIDR0:**

PMCIDR0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFF0</td>
</tr>
</tbody>
</table>
I1.2.8  PMCIDR1, Performance Monitors Component Identification Register 1

The PMCIDR1 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.
This register is part of the Performance Monitors registers functional group.

Usage constraints

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Configurations

PMCIDR1 is in the Debug power domain.
PMCIDR1 is optional to implement in the external register interface.
This register is required for CoreSight compliance.

Attributes

PMCIDR1 is a 32-bit register.

The PMCIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>CLASS</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>PRMBL_1</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bits [31:8]

Reserved, RES0.

CLASS, bits [7:4]

Component class. Reads as 0x9, debug component.

PRMBL_1, bits [3:0]

Preamble. RAZ.

Accessing the PMCIDR1:

PMCIDR1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFFFF</td>
</tr>
</tbody>
</table>

I1.2.9  **PMCIDR2, Performance Monitors Component Identification Register 2**

The PMCIDR2 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

PMCIDR2 is in the Debug power domain.
PMCIDR2 is optional to implement in the external register interface.
This register is required for CoreSight compliance.

**Attributes**

PMCIDR2 is a 32-bit register.

The PMCIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>RES0</td>
<td></td>
<td>PRMBL_2</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_2, bits [7:0]**

Preamble. Must read as 0x05.

**Accessing the PMCIDR2:**

PMCIDR2 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFF8</td>
</tr>
</tbody>
</table>
I1.2.10 PMCIDR3, Performance Monitors Component Identification Register 3

The PMCIDR3 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component. This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

PMCIDR3 is in the Debug power domain.
PMCIDR3 is optional to implement in the external register interface.
This register is required for CoreSight compliance.

**Attributes**

PMCIDR3 is a 32-bit register.

The PMCIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>8</td>
<td>7</td>
</tr>
<tr>
<td>0</td>
<td>PRMBL_3</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**PRMBL_3, bits [7:0]**

Preamble. Must read as 0xB1.

**Accessing the PMCIDR3:**

PMCIDR3 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFFC</td>
</tr>
</tbody>
</table>
### PMCNTENCLR_EL0, Performance Monitors Count Enable Clear register

The PMCNTENCLR_EL0 characteristics are:

**Purpose**

Disables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR\(_x\). Reading this register shows which counters are enabled.

This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

PMCNTENCLR_EL0 is architecturally mapped to AArch64 register PMCNTENCLR_EL0.

PMCNTENCLR_EL0 is architecturally mapped to AArch32 register PMCNTENCLR.

PMCNTENCLR_EL0 is in the Core power domain.

**Attributes**

PMCNTENCLR_EL0 is a 32-bit register.

The PMCNTENCLR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31 30</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>P(_x)</td>
</tr>
</tbody>
</table>

**C, bit [31]**

PMCCNTR_EL0 disable bit. Disables the cycle counter register. Possible values are:

0  When read, means the cycle counter is disabled. When written, has no effect.

1  When read, means the cycle counter is enabled. When written, disables the cycle counter.

**P\(_x\), bit [x] for x = 0 to (N - 1)**

Event counter disable bit for PMEVCNTR\(_x\).

N is the value in PMCR_EL0.N. Bits [30:N] are RAZ/WI.

Possible values of each bit are:

0  When read, means that PMEVCNTR\(_x\) is disabled. When written, has no effect.

1  When read, means that PMEVCNTR\(_x\) is enabled. When written, disables PMEVCNTR\(_x\).
Accessing the PMCNTENCLR_EL0:

PMCNTENCLR_EL0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC20</td>
</tr>
</tbody>
</table>
### I1.2.12 PMCNTENSET_EL0, Performance Monitors Count Enable Set register

The PMCNTENSET_EL0 characteristics are:

**Purpose**

Enables the Cycle Count Register, PMCCNTR_EL0, and any implemented event counters PMEVCNTR<x>. Reading this register shows which counters are enabled. This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

PMCNTENSET_EL0 is architecturally mapped to AArch64 register PMCNTENSET_EL0.

PMCNTENSET_EL0 is architecturally mapped to AArch32 register PMCNTENSET.

PMCNTENSET_EL0 is in the Core power domain.

**Attributes**

PMCNTENSET_EL0 is a 32-bit register.

The PMCNTENSET_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Assignment</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>C</td>
<td>PMCCNTR_EL0 enable bit. Enables the cycle counter register. Possible values are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1</td>
</tr>
<tr>
<td>30</td>
<td>P&lt;x&gt;</td>
<td>Event counter enable bit for PMEVCNTR&lt;x&gt;.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>N is the value in PMCR_EL0.N. Bits [30:N] are RAZ/WI.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Possible values of each bit are:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1</td>
</tr>
</tbody>
</table>
Accessing the PMCNTENSET_EL0:

PMCNTENSET_EL0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC00</td>
</tr>
</tbody>
</table>
I1.2.13   PMCR_EL0, Performance Monitors Control Register

The PMCR_EL0 characteristics are:

**Purpose**

Provides details of the Performance Monitors implementation, including the number of counters implemented, and configures and controls the counters.

This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

PMCR_EL0 is architecturally mapped to AArch64 register PMCR_EL0.

PMCR_EL0 is architecturally mapped to AArch32 register PMCR.

PMCR_EL0 is in the Core power domain.

Bits [31:11] of this register must be implemented as RAZ/WI despite the mapping to the internal PMCR system register. An external agent must use other means to discover this information, such as PMCFGR and the ID registers.

**Attributes**

PMCR_EL0 is a 32-bit register.

The PMCR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>11 10 7 6 5 4 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAZ/WI</td>
<td>RES0</td>
</tr>
</tbody>
</table>

**Bits [31:11]**

Reserved, RAZ/WI.

**Bits [10:7]**

Reserved, RES0.

**LC, bit [6]**

Long cycle counter enable. Determines which PMCCNTR_EL0 bit generates an overflow recorded by PMOVSR[31].

0 Cycle counter overflow on increment that changes PMCCNTR_EL0[31] from 1 to 0.
1 Cycle counter overflow on increment that changes PMCCNTR_EL0[63] from 1 to 0.

ARM deprecates use of PMCR_EL0.LC = 0.

**DP, bit [5]**

Disable cycle counter when event counting is prohibited. The possible values of this bit are:

0 PMCCNTR_EL0, if enabled, counts when event counting is prohibited.
1 PMCCNTR_EL0 does not count when event counting is prohibited.

Event counting is prohibited when ProfilingProhibited(IsSecure(),PSTATE.EL) == TRUE.

This bit is RW.
X, bit [4]

Enable export of events in an IMPLEMENTATION DEFINED event stream. The possible values of this bit are:
0
Do not export events.
1
Export events where not prohibited.

This bit is used to permit events to be exported to another debug device, such as an OPTIONAL trace extension, over an event bus. If the implementation does not include such an event bus, this bit is RAZ/WI.

This bit does not affect the generation of Performance Monitors overflow interrupt requests or signaling to a cross-trigger interface (CTI) that can be implemented as signals exported from the processor.

If the implementation does not include an exported event stream, this bit is RAZ/WI. Otherwise this bit is RW.

D, bit [3]

Clock divider. The possible values of this bit are:
0
When enabled, PMCCNTR_EL0 counts every clock cycle.
1
When enabled, PMCCNTR_EL0 counts once every 64 clock cycles.

This bit is RW.

If PMCR_EL0.LC == 1, this bit is ignored and the cycle counter counts every clock cycle.

ARM deprecates use of PMCR.D = 1.

C, bit [2]

Cycle counter reset. This bit is WO. The effects of writing to this bit are:
0
No action.
1
Reset PMCCNTR_EL0 to zero.

This bit is always RAZ.

Resetting PMCCNTR_EL0 does not clear the PMCCNTR_EL0 overflow bit to 0.

P, bit [1]

Event counter reset. This bit is WO. The effects of writing to this bit are:
0
No action.
1
Reset all event counters, not including PMCCNTR_EL0, to zero.

This bit is always RAZ.

Resetting the event counters does not clear any overflow bits to 0.

E, bit [0]

Enable. The possible values of this bit are:
0
All counters, including PMCCNTR_EL0, are disabled.
1
All counters are enabled by PMCNTENSEL_EL0.

This bit is RW.

Accessing the PMCR_EL0:

PMCR_EL0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xE04</td>
</tr>
</tbody>
</table>
I1.2.14 PMDEVAFF0, Performance Monitors Device Affinity register 0

The PMDEVAFF0 characteristics are:

**Purpose**

Copy of the low half of the processor MPIDR_EL1 register that allows a debugger to determine which processor in a multiprocessor system the Performance Monitor component relates to.

This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

PMDEVAFF0 is in the Debug power domain.

PMDEVAFF0 is optional to implement in the external register interface.

**Attributes**

PMDEVAFF0 is a 32-bit register.

The PMDEVAFF0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>MPIDR_EL1 low half</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

MPIDR_EL1 low half. Read-only copy of the low half of MPIDR_EL1, as seen from the highest implemented exception level.

**Accessing the PMDEVAFF0:**

PMDEVAFF0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFA8</td>
</tr>
</tbody>
</table>
I1.2.15 PMDEVAFF1, Performance Monitors Device Affinity register 1

The PMDEVAFF1 characteristics are:

**Purpose**

Copy of the high half of the processor MPIDR_EL1 register that allows a debugger to determine which processor in a multiprocessor system the Performance Monitor component relates to.

This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

PMDEVAFF1 is in the Debug power domain.

PMDEVAFF1 is optional to implement in the external register interface.

**Attributes**

PMDEVAFF1 is a 32-bit register.

The PMDEVAFF1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>MPIDR_EL1 high half</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

MPIDR_EL1 high half. Read-only copy of the high half of MPIDR_EL1, as seen from the highest implemented exception level.

**Accessing the PMDEVAFF1:**

PMDEVAFF1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFAC</td>
</tr>
</tbody>
</table>
### PMDEVARCH, Performance Monitors Device Architecture register

The PMDEVARCH characteristics are:

**Purpose**

This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

PMDEVARCH is in the Debug power domain.
PMDEVARCH is optional to implement in the external register interface.

**Attributes**

PMDEVARCH is a 32-bit register.

The PMDEVARCH bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>ARCHITECT</td>
<td></td>
<td>Defines the architecture of the component. For Performance Monitors, this is ARM Limited.</td>
</tr>
<tr>
<td>21</td>
<td>REVISION</td>
<td></td>
<td>Defines the architecture revision. For architectures defined by ARM this is the minor revision. For Performance Monitors, the revision defined by v8-A is 0x0.</td>
</tr>
<tr>
<td>15</td>
<td>ARCHID</td>
<td></td>
<td>Defines this part to be a v8-A debug component. For architectures defined by ARM this is further subdivided.</td>
</tr>
</tbody>
</table>

**ARCHITECT, bits [31:21]**

Defines the architecture of the component. For Performance Monitors, this is ARM Limited.

Bits [31:28] are the JEP 106 continuation code, 0x4.
Bits [27:21] are the JEP 106 ID code, 0x3B.

**PRESENT, bit [20]**

When set to 1, indicates that the DEVARC is present.
This field is 1 in v8-A.

**REVISION, bits [19:16]**

Defines the architecture revision. For architectures defined by ARM this is the minor revision.
For Performance Monitors, the revision defined by v8-A is 0x0.
All other values are reserved.

**ARCHID, bits [15:0]**

Defines this part to be a v8-A debug component. For architectures defined by ARM this is further subdivided.

For Performance Monitors:

- Bits [15:12] are the architecture version, 0x2.
- Bits [11:0] are the architecture part number, 0xA16.

This corresponds to Performance Monitors architecture version PMUv3.
Accessing the PMDEVARCH:

PMDEVARCH can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xF8C</td>
</tr>
</tbody>
</table>
11.2.17 PMDEVTYPE, Performance Monitors Device Type register

The PMDEVTYPE characteristics are:

**Purpose**

Indicates to a debugger that this component is part of a processor's performance monitor interface. This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

PMDEVTYPE is in the Debug power domain.
PMDEVTYPE is optional to implement in the external register interface.

**Attributes**

PMDEVTYPE is a 32-bit register.

The PMDEVTYPE bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>SUB</td>
<td>MAJOR</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**SUB, bits [7:4]**

Subtype. Must read as 0x1 to indicate this is a processor component.

**MAJOR, bits [3:0]**

Major type. Must read as 0x6 to indicate this is a performance monitor component.

**Accessing the PMDEVTYPE:**

PMDEVTYPE can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFC</td>
</tr>
</tbody>
</table>
### 11.2.18 PMEVCNTR<\text{n}>_EL0, Performance Monitors Event Count Registers, n = 0 - 30

The PMEVCNTR<\text{n}>_EL0 characteristics are:

**Purpose**

Holds event counter n, which counts events, where n is 0 to 30.

This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

External accesses to the performance monitors ignore PMUSERENR_EL0 and, if implemented, MDCR_EL2.{TPM, TPMCR, HPMN} and MDCR_EL3.TPM. This means that all counters are accessible regardless of the current EL or privilege of the access.

**Configurations**

PMEVCNTR<\text{n}>_EL0 is architecturally mapped to AArch64 register PMEVCNTR<\text{n}>_EL0.

PMEVCNTR<\text{n}>_EL0 is architecturally mapped to AArch32 register PMEVCNTR<\text{n}>.

PMEVCNTR<\text{n}>_EL0 is in the Core power domain.

**Attributes**

PMEVCNTR<\text{n}>_EL0 is a 32-bit register.

The PMEVCNTR<\text{n}>_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>0</td>
</tr>
</tbody>
</table>

**Event counter n**

<table>
<thead>
<tr>
<th>Bit [31:0]</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Event counter n. Value of event counter n, where n is the number of this register and is a number from 0 to 30.</td>
<td></td>
</tr>
</tbody>
</table>

**Accessing the PMEVCNTR<\text{n}>_EL0:**

PMEVCNTR<\text{n}>_EL0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x000 + 8n</td>
</tr>
</tbody>
</table>
I1.2.19 PMEVTYPER<n>_EL0, Performance Monitors Event Type Registers, n = 0 - 30

The PMEVTYPER<n>_EL0 characteristics are:

Purpose

Configures event counter n, where n is 0 to 30.
This register is part of the Performance Monitors registers functional group.

Usage constraints

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>

</tbody>
</table>

Configurations

PMEVTYPER<n>_EL0 is architecturally mapped to AArch64 register PMEVTYPER<n>_EL0.
PMEVTYPER<n>_EL0 is architecturally mapped to AArch32 register PMEVTYPER<n>_EL0.
PMEVTYPER<n>_EL0 is in the Core power domain.

Attributes

PMEVTYPER<n>_EL0 is a 32-bit register.
The PMEVTYPER<n>_EL0 bit assignments are:

```
31 30 29 28 27 26 25 10 9 0
P  U  M  RES0  evtCount
```

P, bit [31]

EL1 modes filtering bit. Controls counting in EL1. If EL3 is implemented, then counting in Non-secure EL1 is further controlled by the NSK bit. The possible values of this bit are:

0  Count events in EL1.
1  Do not count events in EL1.

U, bit [30]

EL0 filtering bit. Controls counting in EL0. If EL3 is implemented, then counting in Non-secure EL0 is further controlled by the NSU bit. The possible values of this bit are:

0  Count events in EL0.
1  Do not count events in EL0.

NSK, bit [29]

Non-secure kernel modes filtering bit. Controls counting in Non-secure EL1. If EL3 is not implemented, this bit is RES0.
If the value of this bit is equal to the value of P, events in Non-secure EL1 are counted.
Otherwise, events in Non-secure EL1 are not counted.
NSU, bit [28]

Non-secure user modes filtering bit. Controls counting in Non-secure EL0. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of U, events in Non-secure EL0 are counted. Otherwise, events in Non-secure EL0 are not counted.

NSH, bit [27]

Non-secure Hyp modes filtering bit. Controls counting in Non-secure EL2. If EL2 is not implemented, this bit is RES0.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Do not count events in EL2.</td>
</tr>
<tr>
<td>1</td>
<td>Count events in EL2.</td>
</tr>
</tbody>
</table>

M, bit [26]

Secure EL3 filtering bit. Most applications can ignore this bit and set the value to zero. If EL3 is not implemented, this bit is RES0.

If the value of this bit is equal to the value of P, events in Secure EL3 are counted. Otherwise, events in Secure EL3 are not counted.

Bits [25:10]

Reserved, RES0.

evtCount, bits [9:0]

Event to count. The event number of the event that is counted by event counter PMEVCNTR<n>_EL0.

Software must program this field with an event defined by the processor or a common event defined by the architecture.

If evtCount is programmed to an event that is reserved or not implemented, the behavior depends on the event type.

For common architectural and microarchitectural events:

- No events are counted.
- The value read back on evtCount is the value written.

For IMPLEMENTATION DEFINED events:

- It is UNPREDICTABLE what event, if any, is counted. UNPREDICTABLE in this case means the event must not expose privileged information.
- The value read back on evtCount is an UNKNOWN value with the same effect.

ARM recommends that the behavior across a family of implementations is defined such that if a given implementation does not include an event from a set of common IMPLEMENTATION DEFINED events, then no event is counted and the value read back on evtCount is the value written.

Accessing the PMEVTYPER<n>_EL0:

PMEVTYPER<n>_EL0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0x400 + 4n</td>
</tr>
</tbody>
</table>
### PMINTENCLR_EL1, Performance Monitors Interrupt Enable Clear register

The PMINTENCLR_EL1 characteristics are:

**Purpose**

Disables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<e> EL0. Reading the register shows which overflow interrupt requests are enabled.

This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

PMINTENCLR_EL1 is architecturally mapped to AArch64 register PMINTENCLR_EL1.
PMINTENCLR_EL1 is architecturally mapped to AArch32 register PMINTENCLR.
PMINTENCLR_EL1 is in the Core power domain.

**Attributes**

PMINTENCLR_EL1 is a 32-bit register.

The PMINTENCLR_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>P&lt;e&gt;</td>
<td></td>
</tr>
</tbody>
</table>

C, bit [31]

PMCCNTR_EL0 overflow interrupt request disable bit. Possible values are:

0  When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
1  When read, means the cycle counter overflow interrupt request is enabled. When written, disables the cycle count overflow interrupt request.

P<e>, bit [x] for x = 0 to (N - 1)

Event counter overflow interrupt request disable bit for PMEVCNTR<e> EL0.

N is the value in PMCR_EL0.N. Bits [30:N] are RAZ/WI.

Possible values are:

0  When read, means that the PMEVCNTR<e> EL0 event counter interrupt request is disabled. When written, has no effect.
1  When read, means that the PMEVCNTR<e> EL0 event counter interrupt request is enabled. When written, disables the PMEVCNTR<e> EL0 interrupt request.
Accessing the PMINTENCLR_EL1:

PMINTENCLR_EL1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC60</td>
</tr>
</tbody>
</table>
I1.2.21 PMINTENSET_EL1, Performance Monitors Interrupt Enable Set register

The PMINTENSET_EL1 characteristics are:

**Purpose**

Enables the generation of interrupt requests on overflows from the Cycle Count Register, PMCCNTR_EL0, and the event counters PMEVCNTR<<x>>_EL0. Reading the register shows which overflow interrupt requests are enabled.

This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

PMINTENSET_EL1 is architecturally mapped to AArch64 register PMINTENSET_EL1.
PMINTENSET_EL1 is architecturally mapped to AArch32 register PMINTENSET.
PMINTENSET_EL1 is in the Core power domain.

**Attributes**

PMINTENSET_EL1 is a 32-bit register.

The PMINTENSET_EL1 bit assignments are:

<table>
<thead>
<tr>
<th>31 30 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>C P&lt;x&gt;</td>
</tr>
</tbody>
</table>

**C, bit [31]**

PMCCNTR_EL0 overflow interrupt request enable bit. Possible values are:

0 When read, means the cycle counter overflow interrupt request is disabled. When written, has no effect.
1 When read, means the cycle counter overflow interrupt request is enabled. When written, enables the cycle count overflow interrupt request.

**P<x>, bit [x] for x = 0 to (N - 1)**

Event counter overflow interrupt request enable bit for PMEVCNTR<<x>>_EL0.
N is the value in PMCR_EL0.N. Bits [30:N] are RAZ/WI.
Possible values are:

0 When read, means that the PMEVCNTR<<x>>_EL0 event counter interrupt request is disabled. When written, has no effect.
1 When read, means that the PMEVCNTR<<x>>_EL0 event counter interrupt request is enabled. When written, enables the PMEVCNTR<<x>>_EL0 interrupt request.
Accessing the PMINTENSETH_EL1:

PMINTENSETH_EL1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC40</td>
</tr>
</tbody>
</table>
### I1.2.22 PMITCTRL, Performance Monitors Integration mode Control register

The PMITCTRL characteristics are:

**Purpose**

Enables the Performance Monitors to switch from default mode into integration mode, where test software can control directly the inputs and outputs of the processor, for integration testing or topology detection.

This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMP DEF</td>
<td>IMP DEF</td>
<td>IMP DEF</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

It is IMPLEMENTATION DEFINED whether PMITCTRL is in the Core power domain or in the Debug power domain.

PMITCTRL is optional to implement in the external register interface.

**Attributes**

PMITCTRL is a 32-bit register.

The PMITCTRL bit assignments are:

```
<table>
<thead>
<tr>
<th>Bit</th>
<th>Assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
</tr>
<tr>
<td>30</td>
<td>RES0</td>
</tr>
<tr>
<td>29</td>
<td>RES0</td>
</tr>
<tr>
<td>28</td>
<td>RES0</td>
</tr>
<tr>
<td>27</td>
<td>RES0</td>
</tr>
<tr>
<td>26</td>
<td>RES0</td>
</tr>
<tr>
<td>25</td>
<td>RES0</td>
</tr>
<tr>
<td>24</td>
<td>RES0</td>
</tr>
<tr>
<td>23</td>
<td>RES0</td>
</tr>
<tr>
<td>22</td>
<td>RES0</td>
</tr>
<tr>
<td>21</td>
<td>RES0</td>
</tr>
<tr>
<td>20</td>
<td>RES0</td>
</tr>
<tr>
<td>19</td>
<td>RES0</td>
</tr>
<tr>
<td>18</td>
<td>RES0</td>
</tr>
<tr>
<td>17</td>
<td>RES0</td>
</tr>
<tr>
<td>16</td>
<td>RES0</td>
</tr>
<tr>
<td>15</td>
<td>RES0</td>
</tr>
<tr>
<td>14</td>
<td>RES0</td>
</tr>
<tr>
<td>13</td>
<td>RES0</td>
</tr>
<tr>
<td>12</td>
<td>RES0</td>
</tr>
<tr>
<td>11</td>
<td>RES0</td>
</tr>
<tr>
<td>10</td>
<td>RES0</td>
</tr>
<tr>
<td>9</td>
<td>RES0</td>
</tr>
<tr>
<td>8</td>
<td>RES0</td>
</tr>
<tr>
<td>7</td>
<td>RES0</td>
</tr>
<tr>
<td>6</td>
<td>RES0</td>
</tr>
<tr>
<td>5</td>
<td>RES0</td>
</tr>
<tr>
<td>4</td>
<td>RES0</td>
</tr>
<tr>
<td>3</td>
<td>RES0</td>
</tr>
<tr>
<td>2</td>
<td>RES0</td>
</tr>
<tr>
<td>1</td>
<td>RES0</td>
</tr>
<tr>
<td>0</td>
<td>IME</td>
</tr>
</tbody>
</table>
```

**IME, bit [0]**

Integration mode enable. When IME == 1, the device reverts to an integration mode to enable integration testing or topology detection. The integration mode behavior is IMPLEMENTATION DEFINED.

0 Normal operation.
1 Integration mode enabled.

On IMPLEMENTATION DEFINED reset, the field resets to 0.

**Accessing the PMITCTRL:**

PMITCTRL can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xF00</td>
</tr>
</tbody>
</table>
I1.2.23 PMLAR, Performance Monitors Lock Access Register

The PMLAR characteristics are:

Purpose

Allows or disallows access to the Performance Monitors registers through a memory-mapped interface.

This register is part of the Performance Monitors registers functional group.

Usage constraints

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>WO</th>
</tr>
</thead>
</table>

Configurations

PMLAR is in the Debug power domain.

If optional memory-mapped access to the external debug interface is supported then an optional Software lock can be implemented as part of CoreSight compliance.

PMLAR ignores writes if the Software lock is not implemented and ignores writes for other accesses to the external debug interface.

The Software lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.

Software uses PMLAR to set or clear the lock, and PMLSR to check the current status of the lock.

Attributes

PMLAR is a 32-bit register.

The PMLAR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>KEY</td>
<td></td>
</tr>
</tbody>
</table>

KEY, bits [31:0]

Lock Access control. Writing the key value 0xC5ACCE55 to this field unlocks the lock, enabling write accesses to this component's registers through a memory-mapped interface.

Writing any other value to this register locks the lock, disabling write accesses to this component's registers through a memory mapped interface.

Accessing the PMLAR:

PMLAR can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xF80</td>
</tr>
</tbody>
</table>
PMLSR, Performance Monitors Lock Status Register

The PMLSR characteristics are:

**Purpose**
Indicates the current status of the software lock for Performance Monitors registers.
This register is part of the Performance Monitors registers functional group.

**Usage constraints**
This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

**Configurations**
PMLSR is in the Debug power domain.
If optional memory-mapped access to the external debug interface is supported then an optional Software lock can be implemented as part of CoreSight compliance.
PMLSR is RAZ if the Software lock is not implemented and is RAZ for other accesses to the external debug interface.
The Software lock provides a lock to prevent memory-mapped writes to the Performance Monitors registers. Use of this lock mechanism reduces the risk of accidental damage to the contents of the Performance Monitors registers. It does not, and cannot, prevent all accidental or malicious damage.
Software uses PMLAR to set or clear the lock, and PMLSR to check the current status of the lock.

**Attributes**
PMLSR is a 32-bit register.
The PMLSR bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:3]</th>
<th>31 3 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
</tr>
<tr>
<td>SLI</td>
<td></td>
</tr>
<tr>
<td>SLK</td>
<td></td>
</tr>
<tr>
<td>nTT</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:3]**
Reserved, RES0.

**nTT, bit [2]**
Not thirty-two bit access required. RAZ.

**SLK, bit [1]**
Software lock status for this component. For an access to LSR that is not a memory-mapped access, or when the software lock is not implemented, this field is RES0.
For memory-mapped accesses when the software lock is implemented, possible values of this field are:

<table>
<thead>
<tr>
<th>0</th>
<th>Lock clear. Writes are permitted to this component's registers.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Lock set. Writes to this component's registers are ignored, and reads have no side effects.</td>
</tr>
</tbody>
</table>
On External debug reset, the field resets to 1.

**SLI, bit [0]**

Software lock implemented. For an access to LSR that is not a memory-mapped access, this field is RAZ. For memory-mapped accesses, the value of this field is IMPLEMENTATION DEFINED. Permitted values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Software lock not implemented or not memory-mapped access.</td>
</tr>
<tr>
<td>1</td>
<td>Software lock implemented and memory-mapped access.</td>
</tr>
</tbody>
</table>

**Accessing the PMLSR:**

PMLSR can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xF4</td>
</tr>
</tbody>
</table>
### I1.2.25 PMOVSCLR_EL0, Performance Monitors Overflow Flag Status Clear register

The PMOVSCLR_EL0 characteristics are:

**Purpose**

Contains the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<\(x\). Writing to this register clears these bits.

This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

PMOVSCLR_EL0 is architecturally mapped to AArch64 register PMOVSCLR_EL0.
PMOVSCLR_EL0 is architecturally mapped to AArch32 register PMOVSR.
PMOVSCLR_EL0 is in the Core power domain.

**Attributes**

PMOVSCLR_EL0 is a 32-bit register.

The PMOVSCLR_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31-30</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>P&lt;(x)&gt;</td>
</tr>
</tbody>
</table>

**C, bit [31]**

PMCCNTR_EL0 overflow bit. Possible values are:

0  
When read, means the cycle counter has not overflowed. When written, has no effect.

1  
When read, means the cycle counter has overflowed. When written, clears the overflow bit to 0.

PMCR_EL0.LC is used to control from which bit of PMCCNTR_EL0 (bit 31 or bit 63) an overflow is detected.

**P<\(x\)>**, bit [\(x\)] for\( x = 0 \) to \((N - 1)\)

Event counter overflow clear bit for PMEVCNTR<\(x\)>.

\(N\) is the value in PMCR_EL0.N. Bits [30:N] are RAZ/WI.

Possible values of each bit are:

0  
When read, means that PMEVCNTR<\(x\)> has not overflowed. When written, has no effect.

1  
When read, means that PMEVCNTR<\(x\)> has overflowed. When written, clears the PMEVCNTR<\(x\)> overflow bit to 0.
Accessing the PMOVSCLR_EL0:

PMOVSCLR_EL0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xC80</td>
</tr>
</tbody>
</table>
I1.2.26 PMOVSET_EL0, Performance Monitors Overflow Flag Status Set register

The PMOVSET_EL0 characteristics are:

**Purpose**

Sets the state of the overflow bit for the Cycle Count Register, PMCCNTR_EL0, and each of the implemented event counters PMEVCNTR<x>.

This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>RW</td>
</tr>
</tbody>
</table>

**Configurations**

PMOVSET_EL0 is architecturally mapped to AArch64 register PMOVSET_EL0.

PMOVSET_EL0 is architecturally mapped to AArch32 register PMOVSET.

PMOVSET_EL0 is in the Core power domain.

**Attributes**

PMOVSET_EL0 is a 32-bit register.

The PMOVSET_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>P&lt;x&gt;</td>
<td></td>
</tr>
</tbody>
</table>

**C, bit [31]**

PMCCNTR_EL0 overflow bit. Possible values are:

- 0 When read, means the cycle counter has not overflowed. When written, has no effect.
- 1 When read, means the cycle counter has overflowed. When written, sets the overflow bit to 1.

**P<x>, bit [x] for x = 0 to (N - 1)**

Event counter overflow set bit for PMEVCNTR<x>.

N is the value in PMCR_EL0.N. Bits [30:N] are RAZ/WI.

Possible values are:

- 0 When read, means that PMEVCNTR<x> has not overflowed. When written, has no effect.
- 1 When read, means that PMEVCNTR<x> has overflowed. When written, sets the PMEVCNTR<x> overflow bit to 1.
Accessing the PMOVSET_EL0:

PMOVSET_EL0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xCC0</td>
</tr>
</tbody>
</table>
I1.2.27 PMPIDR0, Performance Monitors Peripheral Identification Register 0

The PMPIDR0 characteristics are:

Purpose

Provides information to identify a Performance Monitor component.
This register is part of the Performance Monitors registers functional group.

Usage constraints

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

Configurations

PMPIDR0 is in the Debug power domain.
PMPIDR0 is optional to implement in the external register interface.
This register is required for CoreSight compliance.

Attributes

PMPIDR0 is a 32-bit register.
The PMPIDR0 bit assignments are:

| Bits [31:8] | Reserved, RES0. |
| PART_0, bits [7:0] | Part number, least significant byte. |

Accessing the PMPIDR0:

PMPIDR0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFE0</td>
</tr>
</tbody>
</table>
1.2.28 PMPIDR1, Performance Monitors Peripheral Identification Register 1

The PMPIDR1 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.
This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

PMPIDR1 is in the Debug power domain.
PMPIDR1 is optional to implement in the external register interface.
This register is required for CoreSight compliance.

**Attributes**

PMPIDR1 is a 32-bit register.

The PMPIDR1 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Name</th>
<th>Assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>RES0</td>
<td>Reserved</td>
</tr>
<tr>
<td>8</td>
<td>DES_0</td>
<td>Designer, least significant nibble of JEP106 ID code. For ARM Limited, this field is 0b1011.</td>
</tr>
<tr>
<td>4-3</td>
<td>PART_1</td>
<td>Part number, most significant nibble.</td>
</tr>
</tbody>
</table>

**Accessing the PMPIDR1:**

PMPIDR1 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFE4</td>
</tr>
</tbody>
</table>
I1.2.29  PMPIDR2, Performance Monitors Peripheral Identification Register 2

The PMPIDR2 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.
This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

PMPIDR2 is in the Debug power domain.
PMPIDR2 is optional to implement in the external register interface.
This register is required for CoreSight compliance.

**Attributes**

PMPIDR2 is a 32-bit register.
The PMPIDR2 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>REVISION</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>DES_1</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>JEDEC</td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**REVISION, bits [7:4]**

Part major revision. Parts can also use this field to extend Part number to 16-bits.

**JEDEC, bit [3]**

RAO. Indicates a JEP106 identity code is used.

**DES_1, bits [2:0]**

Designer, most significant bits of JEP106 ID code. For ARM Limited, this field is 0b011.

**Accessing the PMPIDR2:**

PMPIDR2 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFE8</td>
</tr>
</tbody>
</table>
### 11.2.30 PMPIDR3, Performance Monitors Peripheral Identification Register 3

The PMPIDR3 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

PMPIDR3 is in the Debug power domain.

PMPIDR3 is optional to implement in the external register interface.

This register is required for CoreSight compliance.

**Attributes**

PMPIDR3 is a 32-bit register.

The PMPIDR3 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>REVAND</td>
<td>CMOD</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:8]**

Reserved, RES0.

**REVAND, bits [7:4]**

Part minor revision. Parts using PMPIDR2.REVISION as an extension to the Part number must use this field as a major revision number.

**CMOD, bits [3:0]**

Customer modified. Indicates someone other than the Designer has modified the component.

**Accessing the PMPIDR3:**

PMPIDR3 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xFEC</td>
</tr>
</tbody>
</table>
I1.2.31 PMPIDR4, Performance Monitors Peripheral Identification Register 4

The PMPIDR4 characteristics are:

**Purpose**

Provides information to identify a Performance Monitor component.

This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

- PMPIDR4 is in the Debug power domain.
- PMPIDR4 is optional to implement in the external register interface.
- This register is required for CoreSight compliance.

**Attributes**

PMPIDR4 is a 32-bit register.

The PMPIDR4 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0</td>
</tr>
<tr>
<td>8-7</td>
<td>SIZE</td>
</tr>
<tr>
<td>4-3</td>
<td>Size of the component. RAZ. Log2 of the number of 4KB pages from the start of the component to the end of the component ID registers.</td>
</tr>
<tr>
<td>0</td>
<td>DES_2</td>
</tr>
</tbody>
</table>

**Accessing the PMPIDR4:**

PMPIDR4 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xF00</td>
</tr>
</tbody>
</table>
### 11.2.32 PMSWINC_EL0, Performance Monitors Software Increment register

The PMSWINC_EL0 characteristics are:

**Purpose**

Increments a counter that is configured to count the Software increment event, event 0x00.

This register is part of the Performance Monitors registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Off</th>
<th>DLK</th>
<th>OSLK</th>
<th>EPMAD</th>
<th>SLK</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>Error</td>
<td>RO</td>
<td>WO</td>
</tr>
</tbody>
</table>

#### Configurations

- PMSWINC_EL0 is architecturally mapped to AArch64 register PMSWINC_EL0.
- PMSWINC_EL0 is architecturally mapped to AArch32 register PMSWINC.
- PMSWINC_EL0 is in the Core power domain.
- PMSWINC_EL0 is optional to implement in the external register interface.
- If this register is implemented, use of it is deprecated.
- If 1 is written to bit \([x]\) from the external debug interface, it is CONSTRAINED UNPREDICTABLE whether or not a SW_INCR event is created for counter \(x\). This is consistent with not implementing the register in the external debug interface.

#### Attributes

PMSWINC_EL0 is a 32-bit register.

The PMSWINC_EL0 bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>30</td>
<td>Reserved, RES0.</td>
</tr>
</tbody>
</table>
| \(x\) | Event counter software increment bit for PMEVCNTR<\(x\)>.
| 0   | No action. The write to this bit is ignored. |
| 1   | It is CONSTRAINED UNPREDICTABLE whether a SW_INCR event is generated for event counter \(x\). |
Accessing the PMSWINC_EL0:

PMSWINC_EL0 can be accessed through the internal memory-mapped interface and the external debug interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>PMU</td>
<td>0xCA0</td>
</tr>
</tbody>
</table>
I1.3 Generic Timer registers

This section describes the Generic Timer registers.
I1.3.1 CNTACR<\text{n}>, Counter-timer Access Control Registers, \text{n} = 0 - 7

The CNTACR<\text{n}> characteristics are:

**Purpose**

Provides top-level access controls for the elements of a timer frame. CNTACR<\text{n}> provides the controls for frame CNTBaseN.

In addition to the CNTACR<\text{n}> control:

- CNTNSAR controls whether CNTACR<\text{n}> is accessible from Non-secure state.
- If frame CNTEL0BaseN is implemented, the CNTEL0ACR in frame CNTBaseN provides additional control of accesses to frame CNTEL0BaseN.

This register is part of the Generic Timer registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>RW</th>
</tr>
</thead>
</table>

In a system that implements both Secure and Non-secure states:

- This register is always accessible in Secure state.
- CNTNSAR.NS<\text{n}> determines whether CNTACR<\text{n}> is accessible in Non-secure state.

**Configurations**

Implemented only if CNTTIDR.FI<\text{n}> is RAO.

An implementation of the counters might not provide configurable access to some or all of the features. In this case, the associated field in the CNTACR<\text{n}> register is:

- RAZ/WI if access is always denied.
- RAO/WI if access is always permitted.

**Attributes**

CNTACR<\text{n}> is a 32-bit register.

The CNTACR<\text{n}> bit assignments are:

| Bits [31:6] | Reserved, RES0 |

<table>
<thead>
<tr>
<th>31</th>
<th>6</th>
<th>5</th>
<th>4</th>
<th>3</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- RPCT
- RVCT
- RFRQ
- RVOFF
- RWVT
- RWPT
**RWPT, bit [5]**

Read/write access to the EL1 Physical Timer registers `CNTP_CVAL`, `CNTP_TVAL`, and `CNTP_CTL`, in frame `<n>`. The possible values of this bit are:

0  No access to the EL1 Physical Timer registers in frame `<n>`. The registers are RES0.
1  Read/write access to the EL1 Physical Timer registers in frame `<n>.

**RWVT, bit [4]**

Read/write access to the Virtual Timer register `CNTV_CVAL`, `CNTV_TVAL`, and `CNTV_CTL`, in frame `<n>`. The possible values of this bit are:

0  No access to the Virtual Timer registers in frame `<n>`. The registers are RES0.
1  Read/write access to the Virtual Timer registers in frame `<n>.

**RVOFF, bit [3]**

Read-only access to `CNTVOFF`, in frame `<n>`. The possible values of this bit are:

0  No access to `CNTVOFF` in frame `<n>`. The register is RES0.
1  Read-only access to `CNTVOFF` in frame `<n>.

**RFRQ, bit [2]**

Read-only access to `CNTFRQ`, in frame `<n>`. The possible values of this bit are:

0  No access to `CNTFRQ` in frame `<n>`. The register is RES0.
1  Read-only access to `CNTFRQ` in frame `<n>.

**RVCT, bit [1]**

Read-only access to `CNTVCT`, in frame `<n>`. The possible values of this bit are:

0  No access to `CNTVCT` in frame `<n>`. The register is RES0.
1  Read-only access to `CNTVCT` in frame `<n>.

**RPCT, bit [0]**

Read-only access to `CNTPCT`, in frame `<n>`. The possible values of this bit are:

0  No access to `CNTPCT` in frame `<n>`. The register is RES0.
1  Read-only access to `CNTPCT` in frame `<n>.

**Accessing the CNTACR<n>:**

`CNTACR<n>` can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x040 + 4n</td>
</tr>
</tbody>
</table>
### CNTCR, Counter Control Register

The CNTCR characteristics are:

**Purpose**

Enables the counter, controls the counter frequency setting, and controls counter behavior during debug.

This register is part of the Generic Timer registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>RW</th>
</tr>
</thead>
</table>

In a system that implements both Secure and Non-secure states, this register is only writable in Secure state.

**Configurations**

There are no configuration notes.

**Attributes**

CNTCR is a 32-bit register.

The CNTCR bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>31-8</td>
<td>FCREQ, Frequency change request</td>
</tr>
<tr>
<td>7-2</td>
<td>RES0, Reserved</td>
</tr>
<tr>
<td>1</td>
<td>HDBG, Halt-on-debug</td>
</tr>
<tr>
<td>0</td>
<td>EN, Enabled</td>
</tr>
</tbody>
</table>

**FCREQ, bits [31:8]**

Frequency change request. Indicates the number of the entry in the frequency table to select.

Selecting an unimplemented entry, or the 0 entry (base frequency) has no effect on the counter.

Resets to 0.

**Bits [7:2]**

Reserved, RES0.

**HDBG, bit [1]**

Halt-on-debug. Controls whether a Halt-on-debug signal halts the system counter:

0    System counter ignores Halt-on-debug.
1    Asserted Halt-on-debug signal halts system counter update.

Reset value is architecturally UNKNOWN.

**EN, bit [0]**

Enables the counter:

0    System counter disabled.
1    System counter enabled.

Resets to 0.
**Accessing the CNTCR:**

CNTCR can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x000</td>
</tr>
</tbody>
</table>
### I1.3.3 CNTCV, Counter Count Value register

The CNTCV characteristics are:

**Purpose**

Indicates the current count value.

This register is part of the Generic Timer registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RW in CNTControlBase, RO in CNTReadBase</td>
</tr>
</tbody>
</table>

**Configurations**

There are no configuration notes.

**Attributes**

CNTCV is a 64-bit register.

The CNTCV bit assignments are:

- CountValue, bits [63:0]
  - Indicates the counter value.

**Accessing the CNTCV:**

CNTCV[31:0] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x008</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTReadBase</td>
<td>0x000</td>
</tr>
</tbody>
</table>

CNTCV[63:32] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x00C</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTReadBase</td>
<td>0x004</td>
</tr>
</tbody>
</table>
11.3.4 CNTELOACR, Counter-timer EL0 Access Control Register

The CNTELOACR characteristics are:

**Purpose**

An implementation of CNTELOACR in the frame at CNTBaseN controls whether the CNTPCT, CNTVCT, CNTFRQ, EL1 Physical Timer, and Virtual Timer registers are visible in the frame at CNTELOBaseN.

This register is part of the Generic Timer registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>RW</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
</tr>
</tbody>
</table>

**Configurations**

CNTELOACR is optional to implement in the external register interface.
In each implemented CNTBaseN frame, CNTELOACR is optional. If it is not implemented:
- Its location is RAZ/WI.
- The registers it controls are not visible in the corresponding CNTELOBaseN frame.

**Attributes**

CNTELOACR is a 32-bit register.

The CNTELOACR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>10 9 8 7 2 1 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td>RES0</td>
</tr>
<tr>
<td>EL0PCTEN</td>
<td>EL0VCTEN</td>
</tr>
<tr>
<td>EL0VTEN</td>
<td>EL0PTEN</td>
</tr>
</tbody>
</table>

**Bits [31:10]**

Reserved, RES0.

**EL0PTEN, bit [9]**

Second view read/write access control for the EL1 Physical Timer registers. This bit controls whether the CNTP_CVAL, CNTP_TVAL, and CNTP_CTL registers in the current CNTBaseN frame are also accessible in the corresponding CNTELOBaseN frame. The possible values of this bit are:

| 0 | No access. Registers are RES0 in the second view. |
| 1 | Access permitted. If the registers are accessible in the current frame then they are accessible in the second view. |
**EL0VTEN, bit [8]**
Second view read/write access control for the Virtual Timer registers. This bit controls whether the
CNTV_CVAL, CNTV_TVAL, and CNTV_CTL registers in the current CNTBaseN frame are also
accessible in the corresponding CNTEL0BaseN frame. The possible values of this bit are:

0  No access. Registers are RES0 in the second view.
1  Access permitted. If the registers are accessible in the current frame then they are
    accessible in the second view.

The definition of this bit means that, if the Virtual Timer registers are not implemented in the current
CNTBaseN frame, then the Virtual Timer register addresses are RES0 in the corresponding
CNTEL0BaseN frame, regardless of the value of this bit.

**Bits [7:2]**
Reserved, RES0.

**EL0VCTEN, bit [1]**
Second view read access control for CNTVCT and CNTFRQ. The possible values of this bit are:

0  CNTVCT is not visible in the second view.
If EL0PCTEN is set to 0, CNTFRQ is not visible in the second view.
1  Access permitted. If CNTVCT and CNTFRQ are visible in the current frame then they
    are visible in the second view.

**EL0PCTEN, bit [0]**
Second view read access control for CNTPCT and CNTFRQ. The possible values of this bit are:

0  CNTPCT is not visible in the second view.
If EL0VCTEN is set to 0, CNTFRQ is not visible in the second view.
1  Access permitted. If CNTPCT and CNTFRQ are visible in the current frame then they
    are visible in the second view.

**Accessing the CNTEL0ACR:**
CNTEL0ACR can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x014</td>
</tr>
</tbody>
</table>
11.3.5 CNTFID0, Counter Frequency ID

The CNTFID0 characteristics are:

**Purpose**

Indicates the base frequency of the system counter.
This register is part of the Generic Timer registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO or RW</th>
</tr>
</thead>
</table>

**Configurations**

The possible frequencies for the system counter are stored as 32-bit words starting with the base frequency, CNTFID0.
A 32-bit word of zero value after the final frequency mode entry marks the end of the frequency modes table.
Typically, the frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialise the table entries as part of its start-up sequence.
If the frequency modes table is in read/write memory, ARM strongly recommends that the frequency modes table is not updated once the system is running.

**Attributes**

CNTFID0 is a 32-bit register.
The CNTFID0 bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Frequency</strong></td>
<td></td>
</tr>
</tbody>
</table>

**Frequency, bits [31:0]**

The base frequency of the system counter, in Hz.

**Accessing the CNTFID0:**

CNTFID0 can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x020</td>
</tr>
</tbody>
</table>
1.3.6 CNTFID<n>, Counter Frequency IDs, n = 1 - 23

The CNTFID<n> characteristics are:

**Purpose**
Indicates alternative system counter update frequencies.
This register is part of the Generic Timer registers functional group.

**Usage constraints**
This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO or RW</th>
</tr>
</thead>
</table>

**Configurations**
CNTFID<n> is optional to implement in the external register interface.
The possible frequencies for the system counter are stored as 32-bit words starting with the base frequency, CNTFID0.
A 32-bit word of zero value after the final frequency mode entry marks the end of the frequency modes table. The only required entry in the table is the entry for CNTFID0.
Typically, the frequency modes table will be in read-only memory. However, a system implementation might use read/write memory for the table, and initialise the table entries as part of its start-up sequence.
If the frequency modes table is in read/write memory, ARM strongly recommends that the frequency modes table is not updated once the system is running.

**Attributes**
CNTFID<n> is a 32-bit register.
The CNTFID<n> bit assignments are:

<table>
<thead>
<tr>
<th>Frequency, bits [31:0]</th>
</tr>
</thead>
</table>

A system counter update frequency, in Hz. Must be an exact divisor of the base frequency. ARM strongly recommends that all frequency values in the table are integer power-of-two divisors of the base frequency.

When the system timer is operating at a lower frequency than the base frequency, the increment applied at each counter update is given by:

increment = (base frequency) / selected frequency

**Accessing the CNTFID<n>:**
CNTFID<n> can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x020 + 4n</td>
</tr>
</tbody>
</table>
I1.3.7 CNTFRQ, Counter-timer Frequency

The CNTFRQ characteristics are:

**Purpose**

Holds the clock frequency of the system counter.

This register is part of the Generic Timer registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

In a system that implements both Secure and Non-secure states, this register is only accessible in Secure state.

**Configurations**

CNTFRQ is architecturally mapped to AArch64 register CNTFRQ_EL0.

CNTFRQ is architecturally mapped to AArch32 register CNTFRQ.

**Attributes**

CNTFRQ is a 32-bit register.

The CNTFRQ bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>30</th>
<th>...</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Clock frequency</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Clock frequency. Indicates the system counter clock frequency, in Hz.

**Accessing the CNTFRQ:**

CNTFRQ can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x010</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x010</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x000</td>
</tr>
</tbody>
</table>
I1.3.8 CNTNSAR, Counter-timer Non-secure Access Register

The CNTNSAR characteristics are:

**Purpose**

Provides the highest-level control of whether frames CNTBaseN and CNTEL0BaseN are accessible by Non-secure accesses.

This register is part of the Generic Timer registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>RW</th>
</tr>
</thead>
<tbody>
<tr>
<td>RES0</td>
<td></td>
</tr>
</tbody>
</table>

In a system that implements both Secure and Non-secure states, this register is only accessible in Secure state.

**Configurations**

There are no configuration notes.

**Attributes**

CNTNSAR is a 32-bit register.

The CNTNSAR bit assignments are:

<table>
<thead>
<tr>
<th>Bits [31:8]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>NS&lt;n&gt;, bit [n], for n = 0 to 7</td>
</tr>
</tbody>
</table>

Non-secure access to frame n. The possible values of this bit are:

- 0: Secure access only. Behaves as RES0 to Non-secure accesses.
- 1: Secure and Non-secure accesses permitted.

If frame CNTBase<n>:

- Is not implemented, then NS<n> is RES0.
- Is not Configurable access, and is accessible only by Secure accesses, then NS<n> is RES0.
- Is not Configurable access, and is accessible only by Non-secure accesses, then NS<n> is RES1.
### Accessing the CNTNSAR:

CNTNSAR can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x004</td>
</tr>
</tbody>
</table>
### CNTP_CTL, Counter-timer Physical Timer Control

The CNTP_CTL characteristics are:

**Purpose**

Control register for the physical timer.

This register is part of the Generic Timer registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>RW</th>
</tr>
</thead>
</table>

CNTACR<\(n\)>:RWPT enables access to this register in frame <\(n\)>.

**Configurations**

CNTP_CTL is architecturally mapped to AArch64 register CNTP_CTL_EL0.

CNTP_CTL is architecturally mapped to AArch32 register CNTP_CTL.

**Attributes**

CNTP_CTL is a 32-bit register.

The CNTP_CTL bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>31</td>
<td>Reserved, RES0.</td>
</tr>
<tr>
<td>3</td>
<td>ENABLE</td>
</tr>
<tr>
<td>2</td>
<td>IMASK</td>
</tr>
<tr>
<td>1</td>
<td>ISTATUS</td>
</tr>
<tr>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer interrupt:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Interrupt not asserted.</td>
</tr>
<tr>
<td>1</td>
<td>Interrupt asserted.</td>
</tr>
</tbody>
</table>

This bit is read-only.

A register write that sets IMASK to 1 latches this bit to reflect the status of the interrupt immediately before that write.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Timer interrupt is not masked.</td>
</tr>
<tr>
<td>1</td>
<td>Timer interrupt is masked.</td>
</tr>
</tbody>
</table>
ENABLE, bit [0]

Enables the timer. Permitted values are:

0  Timer disabled.
1  Timer enabled.

Disabling the timer masks the timer interrupt, but the timer value continues to count down.

Accessing the CNTP_CTL:

CNTP_CTL can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x02C</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTELOBaseN</td>
<td>0x02C</td>
</tr>
</tbody>
</table>
I1.3.10   CNTP_CVAL, Counter-timer Physical Timer CompareValue

The CNTP_CVAL characteristics are:

**Purpose**

Holds the 64-bit compare value for the EL1 physical timer. This register is part of the Generic Timer registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>RW</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

CNTACR<n>.RWPT enables access to this register in frame <n>.

If the implementation supports 64-bit atomic accesses, then the CNTP_CVAL register must be accessible as an atomic 64-bit value.

**Configurations**

CNTP_CVAL is architecturally mapped to AArch64 register CNTP_CVAL_EL0.

CNTP_CVAL is architecturally mapped to AArch32 register CNTP_CVAL.

**Attributes**

CNTP_CVAL is a 64-bit register.

The CNTP_CVAL bit assignments are:

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>0</td>
</tr>
</tbody>
</table>

EL1 physical timer compare value

**Bits [63:0]**

EL1 physical timer compare value.

**Accessing the CNTP_CVAL:**

CNTP_CVAL[31:0] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x020</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTELOBaseN</td>
<td>0x020</td>
</tr>
</tbody>
</table>

CNTP_CVAL[63:32] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x024</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTELOBaseN</td>
<td>0x024</td>
</tr>
</tbody>
</table>
11.3.11 CNTP_TVAL, Counter-timer Physical Timer TimerValue

The CNTP_TVAL characteristics are:

**Purpose**

Holds the timer value for the EL1 physical timer. This provides a 32-bit downcounter.
This register is part of the Generic Timer registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>RW</th>
</tr>
</thead>
</table>

CNTACR<\text{n}>.RWPT enables access to this register in frame <\text{n}>.

**Configurations**

CNTP_TVAL is architecturally mapped to AArch64 register CNTP_TVAL_EL0.
CNTP_TVAL is architecturally mapped to AArch32 register CNTP_TVAL.

**Attributes**

CNTP_TVAL is a 32-bit register.
The CNTP_TVAL bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>EL1 physical timer value</td>
<td></td>
</tr>
</tbody>
</table>

**Bits [31:0]**

EL1 physical timer value.

**Accessing the CNTP_TVAL:**

CNTP_TVAL can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x028</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x028</td>
</tr>
</tbody>
</table>
1.3.12 CNTPCT, Counter-timer Physical Count

The CNTPCT characteristics are:

**Purpose**

Holds the 64-bit physical count value.

This register is part of the Generic Timer registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
<tbody>
<tr>
<td>CNTACR&lt;n&gt;.RPCT enables access to this register in frame &lt;n&gt;.</td>
<td></td>
</tr>
</tbody>
</table>

If the implementation supports 64-bit atomic accesses, then the CNTPCT register must be accessible as an atomic 64-bit value.

**Configurations**

CNTPCT is architecturally mapped to AArch64 register CNTPCT_EL0.

CNTPCT is architecturally mapped to AArch32 register CNTPCT.

**Attributes**

CNTPCT is a 64-bit register.

The CNTPCT bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Physical count value" /></td>
<td></td>
</tr>
</tbody>
</table>

**Bits [63:0]**

Physical count value.

**Accessing the CNTPCT:**

CNTPCT[31:0] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x000</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x000</td>
</tr>
</tbody>
</table>

CNTPCT[63:32] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x004</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x004</td>
</tr>
</tbody>
</table>
I1.3.13  CNTSR, Counter Status Register

The CNTSR characteristics are:

**Purpose**

Provides counter frequency status information.

This register is part of the Generic Timer registers functional group.

**Usage constraints**

This register is accessible as shown below:

```
<table>
<thead>
<tr>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
</tr>
</tbody>
</table>
```

**Configurations**

There are no configuration notes.

**Attributes**

CNTSR is a 32-bit register.

The CNTSR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>8</th>
<th>7</th>
<th>2</th>
<th>1</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>FCACK</td>
<td>RES0</td>
<td>RES0</td>
<td>DBGH</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**FCACK, bits [31:8]**

Frequency change acknowledge. Indicates the currently selected entry in the frequency table.

Selecting an unimplemented entry, or the 0 entry (base frequency) has no effect on the counter.

Resets to 0.

**Bits [7:2]**

Reserved, RES0.

**DBGH, bit [1]**

Indicates whether the counter is halted because the Halt-on-Debug signal is asserted:

0  Counter is not halted.
1  Counter is halted.

Reset value is architecturally UNKNOWN.

**Bit [0]**

Reserved, RES0.
Accessing the CNTSR:

CNTSR can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0x004</td>
</tr>
</tbody>
</table>
11.3.14  CNTTIDR, Counter-timer Timer ID Register

The CNTTIDR characteristics are:

**Purpose**

Indicates the implemented timers in the memory map, and their features. For each value of N from 0 to 7 it indicates whether:

- Frame CNTBaseN is a view of an implemented timer.
- Frame CNTBaseN has a second view, CNTEL0BaseN.
- Frame CNTBaseN has a virtual timer capability.

This register is part of the Generic Timer registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

**Configurations**

There are no configuration notes.

**Attributes**

CNTTIDR is a 32-bit register.

The CNTTIDR bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>28</th>
<th>27</th>
<th>24</th>
<th>23</th>
<th>20</th>
<th>19</th>
<th>16</th>
<th>15</th>
<th>12</th>
<th>11</th>
<th>8</th>
<th>7</th>
<th>4</th>
<th>3</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frame7</td>
<td>Frame6</td>
<td>Frame5</td>
<td>Frame4</td>
<td>Frame3</td>
<td>Frame2</td>
<td>Frame1</td>
<td>Frame0</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Frame<\(n\)> bits [\(4n+3:4n\)], for \(n = 0 \) to \(7\)

A 4-bit field indicating the features of frame CNTBase<\(n\)>.

Bit[3] of the field is RES0.

Bit[2] indicates whether frame CNTBase<\(n\)> has a second view, CNTEL0Base<\(n\)>.

The possible values of this bit are:

<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Frame &lt;(n)&gt; does not have a second view. CNTEL0Base&lt;(n)&gt; is RES0.</td>
</tr>
</tbody>
</table>
| 1      | Frame <\(n\)> has a second view, CNTEL0Base<\(n\)>.

If bit[0] is 0, bit[2] is RES0.

Bit[1] indicates whether both:

- Frame CNTBase<\(n\)> implements the virtual timer registers CNTV_CVAL, CNTV_TVAL, and CNTV_CTL.
- This CNTCTLBase frame implements the virtual timer offset register CNTVOFF<\(n\)>.
The possible values of bit[1] are:

<table>
<thead>
<tr>
<th>Bit[1]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Frame &lt;n&gt; does not have virtual capability. The virtual time and offset registers are RES0.</td>
</tr>
<tr>
<td>1</td>
<td>Frame &lt;n&gt; has virtual capability. The virtual time and offset registers are implemented.</td>
</tr>
</tbody>
</table>

If bit[0] is 0, bit[1] is RES0.

Bit[0] indicates whether frame <n> is implemented. The possible values of this bit are:

<table>
<thead>
<tr>
<th>Bit[0]</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Frame &lt;n&gt; not implemented. All registers associated with the frame are RES0.</td>
</tr>
<tr>
<td>1</td>
<td>Frame &lt;n&gt; is implemented.</td>
</tr>
</tbody>
</table>

**Accessing the CNTTIDR:**

CNTTIDR can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x008</td>
</tr>
</tbody>
</table>
### 11.3.15 CNTV_CTL, Counter-timer Virtual Timer Control

The CNTV_CTL characteristics are:

**Purpose**

Control register for the virtual timer.
This register is part of the Generic Timer registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>RW</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bit [1] of CNTTIDR.Frame<n> indicates whether CNTV_CTL is implemented for frame <n>.
If CNTV_CTL is implemented, CNTACR<n>.RWVT enables access to the register in frame <n>.
If CNTV_CTL is not implemented, the register location is RAZ/WI.

**Configurations**

CNTV_CTL is architecturally mapped to AArch64 register CNTV_CTL_EL0.
CNTV_CTL is architecturally mapped to AArch32 register CNTV_CTL.
CNTV_CTL is optional to implement in the external register interface.

**Attributes**

CNTV_CTL is a 32-bit register.

The CNTV_CTL bit assignments are:

```
    31 3 2 1 0
      RES0 ENABLE IMASK ISTATUS
```

**Bits [31:3]**

Reserved, RES0.

**ISTATUS, bit [2]**

The status of the timer interrupt:

<table>
<thead>
<tr>
<th>0</th>
<th>Interrupt not asserted.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Interrupt asserted.</td>
</tr>
</tbody>
</table>

This bit is read-only.
A register write that sets IMASK to 1 latches this bit to reflect the status of the interrupt immediately before that write.

**IMASK, bit [1]**

Timer interrupt mask bit. Permitted values are:

<table>
<thead>
<tr>
<th>0</th>
<th>Timer interrupt is not masked.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Timer interrupt is masked.</td>
</tr>
</tbody>
</table>
ENABLE, bit [0]

Enables the timer. Permitted values are:

0  Timer disabled.
1  Timer enabled.

Disabling the timer masks the timer interrupt, but the timer value continues to count down.

Accessing the CNTV_CTL:

CNTV_CTL can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x03C</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x03C</td>
</tr>
</tbody>
</table>
I1.3.16 CNTV_CVAL, Counter-timer Virtual Timer CompareValue

The CNTV_CVAL characteristics are:

**Purpose**

Holds the 64-bit compare value for the virtual timer.

This register is part of the Generic Timer registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>RW</th>
</tr>
</thead>
</table>

Bit [1] of CNTTIDR.Frame<\(n\)> indicates whether CNTV_CVAL is implemented for frame \(<n\>.

If CNTV_CVAL is implemented, CNTACR<\(n\)>..RWVT enables access to the register in frame \(<n\>.

If CNTV_CVAL is not implemented, the register location is RAZ/WI.

If the implementation supports 64-bit atomic accesses, then the CNTV_CVAL register must be accessible as an atomic 64-bit value.

**Configurations**

CNTV_CVAL is architecturally mapped to AArch64 register CNTV_CVAL_EL0.

CNTV_CVAL is architecturally mapped to AArch32 register CNTV_CVAL.

CNTV_CVAL is optional to implement in the external register interface.

**Attributes**

CNTV_CVAL is a 64-bit register.

The CNTV_CVAL bit assignments are:

<table>
<thead>
<tr>
<th>63</th>
<th>0</th>
</tr>
</thead>
</table>

Virtual timer compare value

**Bits [63:0]**

Virtual timer compare value.

**Accessing the CNTV_CVAL:**

CNTV_CVAL[31:0] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x030</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTELOBaseN</td>
<td>0x030</td>
</tr>
</tbody>
</table>
CNTV\_CV[63:32] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x034</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x034</td>
</tr>
</tbody>
</table>
### 11.3.17 CNTV_TVAL, Counter-timer Virtual Timer TimerValue

The CNTV_TVAL characteristics are:

**Purpose**

Holds the timer value for the virtual timer.
This register is part of the Generic Timer registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>RW</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Bit [1] of CNTTIDR.Frame<\(n\)> indicates whether CNTV_TVAL is implemented for frame \(\langle n\rangle\).
If CNTV_TVAL is implemented, CNTACR<\(n\)>-RWVT enables access to the register in frame \(\langle n\rangle\).
If CNTV_TVAL is not implemented, the register location is RAZ/WI.

**Configurations**

CNTV_TVAL is architecturally mapped to AArch64 register CNTV_TVAL_EL0.
CNTV_TVAL is architecturally mapped to AArch32 register CNTV_TVAL.
CNTV_TVAL is optional to implement in the external register interface.

**Attributes**

CNTV_TVAL is a 32-bit register.
The CNTV_TVAL bit assignments are:

<table>
<thead>
<tr>
<th>31</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Virtual timer value</td>
</tr>
</tbody>
</table>

**Bits [31:0]**

Virtual timer value.

**Accessing the CNTV_TVAL:**

CNTV_TVAL can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x038</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x038</td>
</tr>
</tbody>
</table>
I1.3.18 CNTVCT, Counter-timer Virtual Count

The CNTVCT characteristics are:

Purpose

Holds the 64-bit virtual count value.
This register is part of the Generic Timer registers functional group.

Usage constraints

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>RO</th>
</tr>
</thead>
</table>

CNTACR<n>.RVCT enables access to this register in frame <n>.

If the implementation supports 64-bit atomic accesses, then the CNTPCT register must be accessible as an atomic 64-bit value.

Configurations

CNTVCT is architecturally mapped to AArch64 register CNTVCT_EL0.
CNTVCT is architecturally mapped to AArch32 register CNTVCT.

Attributes

CNTVCT is a 64-bit register.
The CNTVCT bit assignments are:

<table>
<thead>
<tr>
<th>Bits [63:0]</th>
<th>Virtual count value</th>
</tr>
</thead>
</table>

Accessing the CNTVCT:

CNTVCT[31:0] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x008</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x008</td>
</tr>
</tbody>
</table>

CNTVCT[63:32] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x00C</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0x00C</td>
</tr>
</tbody>
</table>
### 11.3.19 CNTVOFF, Counter-timer Virtual Offset

The CNTVOFF characteristics are:

**Purpose**

Holds the 64-bit virtual offset.

This register is part of the Generic Timer registers functional group.

**Usage constraints**

This register is accessible as shown below:

If the implementation supports 64-bit atomic accesses, then the CNTVOFF register must be accessible as an atomic 64-bit value.

**Configurations**

CNTVOFF is architecturally mapped to AArch64 register CNTVOFF_EL2.

CNTVOFF is architecturally mapped to AArch32 register CNTVOFF.

CNTACR<n>.RVOFF enables access to this register for frame CNTBase<n>.

**Attributes**

CNTVOFF is a 64-bit register.

The CNTVOFF bit assignments are:

<table>
<thead>
<tr>
<th>Bit</th>
<th>Attribute</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>Virtual offset</td>
</tr>
</tbody>
</table>

#### Bits [63:0]

Virtual offset.

**Accessing the CNTVOFF:**

CNTVOFF[31:0] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x018</td>
</tr>
</tbody>
</table>

CNTVOFF[63:32] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0x01C</td>
</tr>
</tbody>
</table>
I1.3.20 CNTVOFF<n>, Counter-timer Virtual Offsets, n = 0 - 7

The CNTVOFF<n> characteristics are:

Purpose
Holds the 64-bit virtual offset for frame CNTBase<n>.
This register is part of the Generic Timer registers functional group.

Usage constraints
This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
<th>RW</th>
</tr>
</thead>
</table>

If the implementation supports 64-bit atomic accesses, then the CNTVOFF<n> registers must be accessible as atomic 64-bit values.

Configurations
CNTVOFF<n> is architecturally mapped to AArch64 register CNTVOFF_EL2.
CNTVOFF<n> is architecturally mapped to AArch32 register CNTVOFF.
CNTVOFF<n> is optional to implement in the external register interface.
CNTVOFF<n> is accessible in the CNTCTLBase register map if CNTACR<n>.RVOFF is 1 and bit [1] of CNTTIDR.Frame<n> is 1.
If bit [1] of CNTTIDR.Frame<n> is 0, or CNTACR<n>.RVOFF is 1, CNTVOFF<n> is RAZ/WI.

Attributes
CNTVOFF<n> is a 64-bit register.

The CNTVOFF<n> bit assignments are:

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>
<td>[63:0]</td>
<td>0</td>
</tr>
</tbody>
</table>

Virtual offset

Bits [63:0]
Virtual offset.

Accessing the CNTVOFF<n>:

CNTVOFF<n>[31:0] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x000 + 8n</td>
</tr>
</tbody>
</table>

CNTVOFF<n>[63:32] can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTCTLBase</td>
<td>0x004 + 8n</td>
</tr>
</tbody>
</table>
I1.3.21 CounterID<\textsubscript{n}>, Counter ID registers, \(n = 0 - 11\)

The CounterID<\textsubscript{n}> characteristics are:

**Purpose**

IMPLEMENTATION DEFINED identification registers 0 to 11 for the memory-mapped Generic Timer.
This register is part of the Generic Timer registers functional group.

**Usage constraints**

This register is accessible as shown below:

<table>
<thead>
<tr>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
</tr>
</tbody>
</table>

**Configurations**

These registers are implemented independently in each of the frames accessed through the different memory maps.

If the implementation of the Counter ID registers requires an architecture version, the value for this version of the ARM Generic Timer is version 0.

The Counter ID registers can be implemented as a set of CoreSight ID registers, comprising Peripheral ID Registers and Component ID Registers. An implementation of these registers for the Generic Timer must use a Component class value of \(0xF\).

**Attributes**

CounterID<\textsubscript{n}> is a 32-bit register.

The CounterID<\textsubscript{n}> bit assignments are:

```
  31  0
  IMPLEMENTATION DEFINED
```

**Accessing the CounterID<\textsubscript{n}>**:

CounterID<\textsubscript{n}> can be accessed through the internal memory-mapped interface:

<table>
<thead>
<tr>
<th>Component</th>
<th>Frame</th>
<th>Offset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Timer</td>
<td>CNTControlBase</td>
<td>0xFD0 + 4n</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTReadBase</td>
<td>0xFD0 + 4n</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTBaseN</td>
<td>0xFD0 + 4n</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTEL0BaseN</td>
<td>0xFD0 + 4n</td>
</tr>
<tr>
<td>Timer</td>
<td>CNTCTRLBase</td>
<td>0xFD0 + 4n</td>
</tr>
</tbody>
</table>
1. Memory-Mapped System Register Descriptions
1.3 Generic Timer registers
Chapter I2
System Level Implementation of the Generic Timer

This chapter defines the system level implementation of the optional Generic Timer. It contains the following sections:

• About the Generic Timer specification on page 12-4680.
• Memory-mapped counter module on page 12-4681.
• Counter module control and status register summary on page 12-4684.
• About the memory-mapped view of the counter and timer on page 12-4686.
• The CNTBaseN and CNTPL0BaseN frames on page 12-4687.
• The CNTCTLBase frame on page 12-4689.
• Providing a complete set of counter and timer features on page 12-4690.
• Gray-count scheme for timer distribution scheme on page 12-4692.

Note

• Generic Timer registers on page 11-4647 describes the System level Generic Timer registers. These registers are memory-mapped.
• Chapter D7 The Generic Timer gives a general description of the Generic Timer, and describes the system control register interface to the Generic Timer.
I2.1 About the Generic Timer specification

Chapter D7 The Generic Timer describes the ARM Generic Timer, and its implementation as an optional extension to an ARMv8 processor implementation. Chapter D7 includes the definition of the low-latency System register interface to the Generic Timer Extension. However, the ARM Generic Timer architecture requires the implementation of some parts of the timer at the system level. This system level implementation includes a memory-mapped interface to the timer that:

- Provides some top-level management of the Generic Timer, that is not available from the System register interface from any PE in the system.
- Provides memory-mapped access to Generic Timer features, for system components that cannot implement a System register interface to the timer. The latency of this memory-mapped access can be significantly higher than the latency of System register accesses.

The Generic Timer architecture defines both a counter and a timer. The counter and timer work in combination, but each has a distinct purpose:

- The counter counts the passing of time.
- The timer schedules the triggering of events.

See About the Generic Timer on page D7-1856 for more information about the timer and the counter. Generic Timer example on page D7-1856 shows a system-wide implementation of the Generic Timer.

Most of this chapter describes the system level implementation of the Generic Timer. Gray-count scheme for timer distribution scheme on page I2-4692 describes a possible scheme for distributing the counter value across this system.

I2.1.1 The memory-mapped view of the Generic Timer

The memory-mapped view of the Generic Timer provides:

- Access to the system level features of the Generic Timer:
  - Memory-mapped counter module on page I2-4681 describes these features.
  - Counter module control and status register summary on page I2-4684 describes the memory-mapped interface to those features.

- Memory-mapped access to the Generic Timer features defined in Chapter D7 The Generic Timer. This provides memory-mapped access to different views of the system control registers described in that chapter. About the memory-mapped view of the counter and timer on page I2-4686 describes this access.
### I2.2 Memory-mapped counter module

The memory-mapped counter module provides top-level control of the system counter. It provides:

- A RW control register `CNTCR`, that provides:
  - An enable bit for the system counter.
  - An enable bit for Halt-on-Debug. When this is enabled, if the debug halt signal into the system counter is asserted, it halts the system counter. Otherwise, the system counter ignores the state of this halt signal. For more information about Halt-on-Debug, contact ARM.
  - A field that can be written to request a change to the update frequency of the system counter, with a corresponding change to the increment made at each update. For more information see *Control of counter operating frequency and increment* on page I2-4682.

Writes to this register are rare. In a system that uses security, this register is writable only by Secure writes.

- A RO status register, `CNTSR`, that provides:
  - A bit that indicates whether the system counter is halted because of an asserted Halt-on-Debug signal.
  - A field that indicates the current update frequency of the system counter. This field can be polled to determine when a requested change to the update frequency has been made.

- Two contiguous RW registers that hold the current system counter value, `CNTCV`. If the system supports 64-bit atomic accesses, these two registers must be accessible by such accesses.
  - The system counter must be disabled before writing to these registers, otherwise the effect of the write is UNPREDICTABLE.

Writes to these registers are rare. In a system that uses security, these registers are writable only by Secure writes.

- A table of one or more 32-bit entries, where:
  - The first entry defines the base frequency of the system counter. This is the maximum frequency at which the counter updates.
  - Each subsequent entry defines an alternative frequency of the system counter, and must be an exact divisor of the base frequency.

A 32-bit zero entry immediately follows the last table entry.

This table can be WO or RW. For more information, see *The frequency modes table* on page I2-4682.

- Two contiguous RO registers that hold the current system counter value, `CNTCV`. If the system supports 64-bit atomic accesses, these two registers must be accessible by such accesses.

These registers are located in two memory frames, identified by different base addresses:

- The locations of the RO copies of `CNTCV` are defined relative to the `CNTReadBase` base address.
- The locations of all the other registers are defined relative to the `CNTControlBase` base address.

--- **Note**

The final twelve words of the first or only 4KB block of a register memory frame is an ID block.

*Counter module control and status register summary* on page I2-4684 describes `CNTReadBase` and `CNTControlBase` memory maps, and the registers in each frame.
I2.2.1 Control of counter operating frequency and increment

The system counter has a fixed base frequency, and must maintain the required counter accuracy, meaning ARM recommends that it does not gain or lose more than ten seconds in a 24-hour period, see System counter on page D7-1857. However, the counter can increment at a lower frequency than the base frequency, using a correspondingly larger increment. For example, it can increment by four at a quarter of the base frequency. Any lower-frequency operation, and any switching between operating frequencies, must not reduce the accuracy of the counter.

Control of the system counter frequency and increment is provided only through the memory-mapped counter module. The following sections describe this control:

• The frequency modes table
• Changing the system counter and increment.

The frequency modes table

The frequency modes table starts at offset 0x20 from CNTControlBase.

Table entries are 32-bits, and each entry specifies a system counter update frequency, in Hz.

The first entry in the table specifies the base frequency of the system counter.

To ensure overall counter accuracy is maintained, any subsequent entries in the table must be exact divisors of the base frequency. That is, ARM strongly recommends that all frequency values in the table are integer power-of-two divisors of the base frequency.

When the system timer is operating at a lower frequency than the base frequency, the increment applied at each counter update is given by:

\[
\text{increment} = \frac{\text{base\_frequency}}{\text{selected\_frequency}}
\]

A 32-bit word of zero value marks the end of the table. That is, the word of memory immediately after the last entry in the table must be zero.

The only required entry in the table is the entry for the base frequency.

Typically, the frequency modes table are in RO memory. However, a system implementation might use RW memory for the table, and initialize the table entries as part of its startup sequence. Therefore, the CNTControlBase memory map shows the table region as RO or RW.

ARM strongly recommends that the frequency modes table is not updated once the system is running.

The architecture can support up to 1004 entries in the frequency modes table, and the maximum number of entries is IMPLEMENTATION DEFINED, up to this limit.

Note

ARM considers it unlikely that implementations will require significantly fewer entries than the architectural limit.

Changing the system counter and increment

The CNTCR.FREQ field defines which frequency modes table entry specifies the system counter update frequency. The value in the FCREQ specifies the entry.

Changing the value of CNTCR.FREQ requests a change to the system counter update frequency. To ensure the frequency change does not affect the overall accuracy of the counter, it is made as follows:

• When changing from a higher frequency to a lower frequency, the counter:
  1. Continues running at the higher frequency until the count reaches an integer multiple of the required lower frequency.
  2. Switches to operating at the lower frequency.
• When changing from a lower frequency to a higher frequency, the counter:
  1. Waits until the end of the current lower-frequency cycle.
2. Makes the counter increment required for operation at that lower frequency.
3. Switches to operating at the higher frequency.

When the frequency has changed, CNTSR is updated to indicate the new frequency. Therefore, a system component that is waiting for a frequency change can poll CNTSR to detect the change.
I2.3 Counter module control and status register summary

The Counter module control and status registers are memory-mapped registers in the following register memory frames:

- A control frame, with base address CNTControlBase.
- A status frame, with base address CNTReadBase.

Each of these register memory frames is at least 4KB in size, or is at least the size of the memory protection granule if this granule size is larger than 4KB. Similarly, each base address must be aligned to 4KB, or to the memory protection granule if that is larger than 4KB.

Note
The memory protection granule is either 4KB or 64KB.

In each register memory frame, the memory at offset 0xFD0-0xFFF is reserved for twelve 32-bit IMPLEMENTATION DEFINED ID registers, see the CounterID<n> register descriptions for more information.

The counter is assumed to be little-endian.

In an implementation that supports Secure and Non-secure memory spaces, CNTControlBase is implemented only in the Secure memory space.

Table I2-1 shows the CNTControlBase control registers, in order of their offsets from CNTControlBase. Generic Timer registers on page I1-4647 describes each of these registers.

### I2.4 About the memory-mapped view of the counter and timer

To provide the Generic Timer functionality to any programmable system components that cannot implement a coprocessor interface to the Generic Timer, the Generic Timer specification defines a memory-mapped component that can be placed close to such a component. ARM recommends that the system implementation includes an instance of this memory-mapped structure for each system component requiring memory-mapped access to the Generic Timer.

The memory map consists of up to 8 timer frames. Each timer frame:

- Provides its own set of timers and associated interrupts.
- Is in its own memory protection region that is:
  - In its own memory protection region, with a system-defined size of 4KB or 64KB.
  - At a start address that is aligned to 4KB.

**Note**

The 4KB alignment requirement applies regardless of the memory protection region size.

The base address of a frame is CNTBase\(_N\), where \(N\) numbers from 0 up to a maximum permitted value of 7.

The system provides a second view of each implemented CNTBase\(_N\) frame. The base address of the second view of the CNTBase\(_N\) frame is CNTPL0Base\(_N\), and in this view:

- All registers visible in CNTBase\(_N\) are visible, except for CNTVOFF and CNTEL0ACR.
- The offsets of all visible registers are the same as their offsets in the CNTBase\(_N\) frame.

In addition, the system provides a control frame at base address CNTCTLBase.

The memory protection region and alignment requirements for the CNTPL0Base\(_N\) and CNTCTLBase frames are the same as the requirements for the CNTBase\(_N\) frames.

The system defines the position of each frame in the memory map. This means the values of each of the CNTBase\(_N\), CNTPL0Base\(_N\), and CNTCTLBase base addresses is IMPLEMENTATION DEFINED.

The memory-mapped timers are assumed to be little-endian.

The following sections describe the implementation of a memory-mapped view of the counter and timer:

- *The CNTBase\(_N\) and CNTPL0Base\(_N\) frames on page I2-4687.*
- *The CNTCTLBase frame on page I2-4689.*
- *Providing a complete set of counter and timer features on page I2-4690.*
I2.5 The CNTBaseN and CNTPL0BaseN frames

Table I2-3 shows the CNTBaseN registers, in order of their offsets from CNTBaseN. Whether a frame includes a virtual timer is IMPLEMENTATION DEFINED. If it does not then memory at offsets 0x030-0x03C is RAZ/WI. Except for CNTEL0ACR and the CounterID<n> registers, these registers are also implemented in the system control register interface to the Generic Timer.

Generic Timer registers on page I1-4647 describes each of these registers.

Table I2-3 CNTBaseN memory map

---

For any value of N, the layout of the registers in the frame at CNTPL0BaseN is identical to that at CNTBaseN, except that:

- CNTVOFF is not visible, and the memory at 0x018-0x01C is RAZ/WI.
- CNTEL0ACR is never visible, and the memory at 0x014 is always RAZ/WI.
If implemented in the frame at CNTBaseN, CNTEL0ACR controls whether CNTPCT, CNTVCT, CNTFRQ, the EL1 Physical Timer, and the Virtual Timer registers are visible in the frame at CNTPL0BaseN.

If CNTEL0ACR is not implemented then these registers are not visible in the frame at CNTPL0BaseN, and their addresses are RAZ/WI.

If CNTFRQ is visible it is always RO. That is, it is not RW for initial configuration.

If an implementation supports 64-bit atomic accesses, then CNTPCT, CNTVCT, CNTVOFF, CNTP_CVAL, and CNTV_CVAL must be accessible as atomic 64-bit values.
### I2.6 The CNTCTLBase frame

The CNTCTLBase frame contains an identification register for the features of the memory-mapped counter and timer implementation, access controls for each CNTBase frame, and a virtual offset register for frames that implement a virtual timer. Table I2-4 shows the CNTCTLBase registers, in order of their offsets from CNTCTLBase. The CNTFRQ and CNTVOFF registers are also implemented in the Secure system control register interface to the Generic Timer.

*Generic Timer registers on page I1-4647* describes each of these registers.

---

</tr>
</tbody>
</table>

\(^{a}\) These registers are also defined in the Secure System registers interface to the Generic Timer, and therefore are also described in *Generic Timer registers on page D8-2170* and *Generic Timer registers on page G4-4208*. The bit assignments of the registers are identical in the System registers interface and in the memory-mapped system level interface.

\(^{b}\) Implemented for each value of \(N\) from 0 to 7.

\(^{c}\) The CNTNSAR determines the Non-secure accessibility of the CNTACR\(<n>\)\(^s\) and the CNTVOFF\(<n>\)\(^s\) in the CNTCTLBase frame. For more information, see the register descriptions.

\(^{d}\) Address is reserved, RAZ/WI if register not implemented.
## 12.7 Providing a complete set of counter and timer features

Using the general model for implementing a memory-mapped interface to the Generic Timer described in this section, the feature set of a System registers counter and timer, in an implementation that includes EL2 and EL3, can be implemented using the following set of timer frames:

- A CNTCTLBase control frame.
- The following CNTBaseN timer frames:
  - **Frame 0** Accessible from Non-secure state, with second view and virtual capability. This provide the Non-secure EL1&0 timers.
  - **Frame 1** Accessible from Non-secure state, with no second view and no virtual capability. This provide the Non-secure EL2 timers.
  - **Frame 2** Accessible only Secure state, with a second view but no virtual capability. This provide the Secure EL1&0 timers.

In this implementation, the full set of implemented frames, and their configuration in the memory map, is as follows:

### CNTCTLBase
The control frame. This frame is located in both Secure and Non-secure physical memory, and:
- In the Secure EL1&0 translation regime, this frame is accessible only at EL1.
- In the Non-secure EL2 translation regime, this frame is accessible.
- In the Non-secure EL1&0 translation regime, this frame is not accessible.

### CNTBase0
The first view of the Non-secure EL1&0 timers. This frame is located only in Non-secure physical memory, and:
- In the Secure EL1&0 translation regime, this frame is accessible only at EL1.
- In the Non-secure EL2 translation regime, this frame is accessible.
- In the Non-secure EL1&0 translation regime, this frame is accessible at EL1.

### CNTPL0Base0
The second view of CNTBase0, meaning it is the EL0 view of the Non-secure EL1&0 timers. This frame is located only in Non-secure physical memory, and:
- In the Secure EL1&0 translation regime, this frame can be accessible at EL1, or at EL1 and EL0, but this is not required.
- In the Non-secure EL2 translation regime, this frame is accessible.
- In the Non-secure EL1&0 translation regime, this frame is accessible at EL1 and EL0.

### CNTBase1
The first and only view of the Non-secure EL2 timers. This frame is located only in Non-secure physical memory, and:
- In the Secure EL1&0 translation regime, this frame is accessible only at EL1.
- In the Non-secure EL2 translation regime, this frame is accessible.
- In the Non-secure EL1&0 translation regime, this frame is not accessible.

### CNTBase2
The first view of the Secure EL1&0 timers. This frame is located only in Secure physical memory, and:
- In the Secure EL1&0 translation regime, this frame is accessible only at EL1.
- Because the frame is in Secure memory, it is not accessible in any Non-secure translation regime.

### CNTPL0Base2
The second view of CNTBase2, meaning it is the EL0 view of the Secure EL1&0 timers. This frame is located only in Secure physical memory, and:
- In the Secure EL1&0 translation regime, this frame is accessible at EL1 and EL0.
- Because the frame is in Secure memory, it is not accessible in any Non-secure translation regime.
Note

*About VMSAv8-32 on page G3-3562* describes the translation regimes.
I2.8 Gray-count scheme for timer distribution scheme

The distribution of the Counter value using a Gray-code provides a relatively simple mechanism to avoid any danger of the count being sampled with an intermediate value even if the clocking is asynchronous. It has a further advantage that the distribution is relatively low power, since only one bit changes on the main distribution wires for each clock tick.

A suitable Gray-coding scheme can be achieved with the following logic:

- Gray[N] = Count[N]
- Gray[i] = (XOR(Gray[N;i+1])) XOR Count[i] for N-1 >= i >= 0
- Count[i] = XOR(Gray[N;i]) for N >= i >= 0

This is for an N+1 bit counter, where Count is a conventional binary count value, and Gray is the corresponding Gray count value.

Note

This scheme has the advantage of being relatively simple to switch, in either direction, between operating with low-frequency and low-precision, and operating with high-frequency and high-precision. To achieve this, the ratio of the frequencies must be 2^n, where n is an integer. A switch-over can occur only on the 2n+1 boundary to avoid losing the Gray-coding property on a switch-over.
Chapter I3
Recommended Memory-mapped Interfaces to the Performance Monitors

This chapter describes the recommended memory-mapped and external debug interfaces to the Performance Monitors. It contains the following section:

• About the memory-mapped views of the Performance Monitors registers on page I3-4694.

Note
Performance Monitors registers on page I1-4599 describes the memory-mapped registers for the Performance Monitors.
I3 Recommended Memory-mapped Interfaces to the Performance Monitors
I3.1 About the memory-mapped views of the Performance Monitors registers

A memory-mapped view of the Performance Monitors registers accesses the same registers as the System registers interface described in Performance Monitors Extension registers on page D6-1851, except that:

1. The PMSELR is accessible only in the System registers interface.

2. The PMCFGR, PMLAR, PMLSR, PMAUTHSTATUS, PMDEVTYPEx, PMPIDRx0, PMPIDRx1, PMPIDRx2, PMPIDRx3, PMPIDRx4, PMCIDRx0, PMCIDRx1, PMCIDRx2 and PPMCIDRx3 registers are accessible only in memory-mapped views. Performance Monitors registers on page I1-4599 describes these registers.

3. The following controls do not affect the memory-mapped view:
   - PMSELR.
   - PMUSERENR.
   - HDCR.{TPM, TPMCR, HPMN}.

Instead, see the register descriptions in Chapter I1 Memory-Mapped System Register Descriptions.

I3.2 Synchronization of changes to the memory-mapped views

If a Performance Monitor is visible in both system register and a memory-mapped views, and is accessed simultaneously through these two mechanisms, the behavior must be as if the access occurred atomically in any order. For more information, see Synchronization of changes to the external debug registers on page H8-4445.

I3.3 Performance Monitors memory-mapped register views

Table I3-1 on page I3-4695 shows the memory-mapped view of the Performance Monitors registers. All other entries are reserved.

Note

- Counters that are reserved because HDCR.HPMN has been changed from its reset value remain visible in any memory-mapped view.
• The registers that relate to an implemented event counter, PMN<sub>x</sub>, are PMEVCNTR<sub>&lt;n&gt;</sub> and PMEVTYPER<sub>&lt;n&gt;</sub>.

</tbody>
</table>

a. These registers are also defined in the System registers interface to the Performance Monitors.
b. The interface must support at least single-copy atomic 32-bit accesses. If single-copy atomic 64-bit access to the registers is not possible, software must use a high-low-high read access to read the counter value if the counter is enabled.
c. These registers are defined only in the memory-mapped views of the Performance Monitors.

### I3.1.4 Access permissions for memory-mapped views of the Performance Monitors

For more information, see External debug interface register access permissions on page H8-4451.

Table I3-2 on page I3-4696 shows the access permissions for the Performance Monitors registers in a v8 Debug implementation. This table uses the following terms:

- **DLK**: When the OS Double Lock is locked, EDPRSR.DLK == 1, accesses to some registers produce an error. Applies to both interfaces.
I3.1 About the memory-mapped views of the Performance Monitors registers

**EPMAD**
When `AllowExternalPMUAccess()` == FALSE, external debug access is disabled. See also *Behavior of a not permitted memory-mapped access on page H8-4450.*

**Error**
Indicates that the access gives an error response.

**Default**
This shows the default access permissions, if none of the conditions in this list prevent access to the register.

**Off**
When `EDPRSR.PU` == 0, the Core power domain is completely off, or in a low-power state where the Core power domain registers cannot be accessed.

---

**Note**
If debug power is off, then all external debug interface accesses return an error.

**OSLK**
When the OS Lock is locked, `OSLAR_EL1.OSLK` == 1, accesses to some registers produces an error. This column shows the effect of this control on accesses using the external debug interface.

**SLK**
This indicates the modified default access permissions for *optional* memory-mapped accesses to the external debug interface if the *optional* Software lock is locked. See *Register access permissions for memory-mapped accesses on page H8-4449.*

For all other accesses, this column is ignored.

- Indicates that the control has no effect on the behavior of the access:
  - If no other control affects the behavior, the Default access behavior applies.
  - However, another control might determine the behavior.

---

**I3.1.5 Power domains and Performance Monitors registers reset**

For ARMv8-A implementations, ARM recommends that Performance Monitors are implemented as part of the core power domain, not as part of a separate debug power domain. There is no interface to access the Performance Monitors registers when the core power domain is powered down.

A Warm or Cold reset sets the Performance Monitors registers to their reset values. An External Debug reset does not change the values of the Performance Monitors registers.

For more information about the reset scheme recommended for a v8 Debug implementation see Chapter H6 Debug Reset and Powerdown Support.

Table I3-3 shows the Performance Monitors register resets for writable register fields. The column headings use the following terms:

- **64**: This is the architectural reset value when resetting into AArch64 state.
- **32**: This is the architectural reset value when resetting into AArch32 state.
- **-**: This indicates an IMPLEMENTATION DEFINED reset value on the specified reset. This might be UNKNOWN.

---

**Note**

This table does not include:

- Read-only identification registers and fields that have a fixed value. In this case, the reset value is that fixed value. An example of this is PMCR_EL0.N.
- Write-only registers and fields that only have an effect on writes. These do not have a reset value. An example of this is PMSWINC_EL0.
- IMPLEMENTATION DEFINED registers. In this case, the reset domains are IMPLEMENTATION DEFINED. The reset values are IMPLEMENTATION DEFINED and might be UNKNOWN.

---

Architectural Constraints on UNPREDICTABLE behaviors

This chapter describes the architectural constraints on UNPREDICTABLE behaviors in the ARMv8 architecture. It contains the following sections:

• AArch32 CONSTRAINED UNPREDICTABLE behaviors on page AppxA-4702.
• Constraints on AArch64 state UNPREDICTABLE behaviors on page AppxA-4765.
A.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

ARMv8 defines architecturally-required constraints on many behaviors that are UNPREDICTABLE in ARMv7. The following sections define those constraints:

- Overview of the constraints on ARMv7 UNPREDICTABLE behaviors.
- CONSTRAINED UNPREDICTABLE behavior for A32 and T32 instructions.
- CONSTRAINED UNPREDICTABLE behavior, A32 and T32 system instructions on page AppxA-4753.
- CONSTRAINED UNPREDICTABLE behavior in Debug state on page AppxA-4759.
- Using R13 on page AppxA-4759.
- SBZ or SBO fields in instructions on page AppxA-4760.
- CONSTRAINED UNPREDICTABLE behavior in an IT block on page AppxA-4761.
- Branching into an IT block on page AppxA-4762.
- Syndrome register handling for CONSTRAINED UNPREDICTABLE instructions treated as UNDEFINED on page AppxA-4762.
- Unallocated values in register fields of CP14 and CP15 registers and translation table entries on page AppxA-4762.
- Unallocated CP14 and CP15 instructions on page AppxA-4763.
- Loads and Stores to unaligned locations on page AppxA-4763.
- Branching to an unaligned PC on page AppxA-4763.
- Unpredictable CPACR and NSACR settings on page AppxA-4763.
- Instruction fetches from Device memory on page AppxA-4764.
- Multi-access instructions that load the PC from Device memory on page AppxA-4764.
- Out of range virtual address on page AppxA-4764.
- Translation Table Base Address alignment on page AppxA-4764.

A.1.1 Overview of the constraints on ARMv7 UNPREDICTABLE behaviors

The term UNPREDICTABLE describes a number of cases where the architecture has a feature that software must not use. For execution in AArch32 state, where previous versions of the architecture define behavior as UNPREDICTABLE, the ARMv8-A architecture specifies a narrow range of permitted behaviors. This range is the range of CONSTRAINED UNPREDICTABLE behavior. All implementations that are compliant with the architecture must follow the CONSTRAINED UNPREDICTABLE behavior.

Note
Software designed to be compatible with the ARMv8-A architecture must not rely on these CONSTRAINED UNPREDICTABLE cases being handled in any way other than those listed under the heading CONSTRAINED UNPREDICTABLE.

A.1.2 CONSTRAINED UNPREDICTABLE behavior for A32 and T32 instructions

This section lists the CONSTRAINED UNPREDICTABLE behavior for the different A32 and T32 instructions listed in Alphabetical list of T32 and A32 base instruction set instructions on page F7-2534 and Alphabetical list of floating-point and Advanced SIMD instructions on page F8-3076.

BFC

For a description of these instructions and the encodings, see BFC on page F7-2568.

CONSTRAINED UNPREDICTABLE behavior

If msbit < lsbit, then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
The output value is the registers in UNKNOWN.

BFI

For a description of these instructions and the encodings, see BFI on page F7-2569.

CONSTRAINED UNPREDICTABLE behavior

If \texttt{msbit} < \texttt{lsbit}, then one of the following behaviors can occur:
- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The output value is the registers in UNKNOWN.

BKPT

For a description of this instruction and the encoding, see BKPT on page F7-2575.

CONSTRAINED UNPREDICTABLE behavior

For the A1 encoding:
- If \texttt{cond} \neq \texttt{'1110'}, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction executes unconditionally.
  - The instruction executes conditionally.

CLZ

For a description of this instruction and the encoding, see CLZ on page F7-2585.

CONSTRAINED UNPREDICTABLE behavior

For the T1 encoding:
- If \texttt{!consistent}(Rn), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The register specified by hw1[3:0] is used as the source register.
  - The register specified by hw2[3:0] is used a the source register.
  - The value in the destination register is UNKNOWN.

CMP (register)

For a description of this instruction and the encoding, see CMP (register) on page F7-2590.

CONSTRAINED UNPREDICTABLE behavior

For the T2 encoding:
- If \texttt{n < 8} \&\& \texttt{m < 8}, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs the comparison between Rn and Rm.
  - The condition flags become UNKNOWN.
CRC32, CRC32C
For a description of this instruction and the encoding, see CRC32, CRC32C on page F7-2594.

CONSTRAINED UNPREDICTABLE behavior
If size == 64, then one of the following behaviors can occur:
• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction behaves as if sz == '10'.

For the A1 encoding:
• If cond! = '1110', then one of the following behaviors can occur:
  • The instruction is UNDEFINED.
  • The instruction executes as a NOP.
  • The instruction is executed unconditionally.
  • The instruction is executed conditionally.

HLT
For a description of this instruction and the encoding, see HLT on page F7-2608.

CONSTRAINED UNPREDICTABLE behavior
For the A1 encoding:
• If cond != '1110', then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction is executed unconditionally.
  — The instruction is executed conditionally.

IT
For a description of this instruction and the encoding, see IT on page F7-2610.

CONSTRAINED UNPREDICTABLE behavior
For the T1 encoding:
• If firstcond == '1111'||(firstcond == '1110' && BitCount(mask)!= 1) then one of the following behaviors occurs:
  — The instruction is undefined.
  — The instruction executes as a NOP.
  — firstcond == '1111' is treated the same as firstcond == '1110', meaning the always condition, and the ITSTATE state machine is progressed in the same way as for any other cond_base value.

LDC/LDC2 (literal)
For a description of this instruction and the encoding, see LDC, LDC2 (literal) on page F7-2622.

CONSTRAINED UNPREDICTABLE behavior
If W == '1' || (P == '0' & CurrentInstrSet() != InstrSet_A480, then one of the following behaviors can occur:
• The instruction is undefined.
• The instruction executes as a NOP.
• The load instruction operates without writeback.
Appendix A Architectural Constraints on UNPREDICTABLE behaviors
A.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

Note
This is consistent with ignoring writes to the PC.

- The instruction uses the addressing mode described in the equivalent immediate offset instruction.

LDM/LDMIA/LDMFD (T32)
For a description of this instruction and the encoding, see LDM/LDMIA/LDMFD (T32) on page F7-2624.

CONSTRAINED UNPREDICTABLE behavior
For the T1 encoding:

- If $\text{BitCount}(\text{registers}) < 1$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction operates as an LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

For the T2 encoding:

- If $\text{BitCount}(\text{registers}) < 2$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction loads a single register using the specified addressing modes.
  - The instruction operates as an LDM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

- If $\text{hw2}[13]$ is set to 1, then one of the following behaviors can occur:
  - The instruction is undefined.
  - The instruction executes as a NOP.
  - The instruction performs all of the loads using the specified addressing mode, but R13 is UNKNOWN.

Note
This is an exception to the requirements described in SBZ or SBO fields in instructions on page AppxA-4760.

- If $P == '1' \&\& M == '1'$, then one of the following behaviors can occur:
  - The instruction is undefined.
  - The instruction executes as a NOP.
  - The instruction loads the register list and either R14 or R15, both R14 and R15, or neither of these registers.

- If $\text{wback} \&\& \text{registers}<n> == '1'$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the loads using the specified addressing mode, and the content of the register being written back in UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

LDM/LDMIA/LDMFD (A32)
For a description of this instruction and the encoding, see LDM/LDMIA/LDMFD (A32) on page F7-2626.
CONSTRAINED UNPREDICTABLE behavior

For the A1 encoding:

- If `BitCount(registers) < 1`, then one of the following behaviors can occur:
  - The instruction is **UNDEFINED**.
  - The instruction executes as a NOP.
  - The instruction operates as an `LDM` with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

- If `wback && registers<n> == '1'`, then one of the following behaviors can occur:
  - The instruction is **UNDEFINED**.
  - The instruction executes as a NOP.
  - The instruction performs all of the loads using the specified addressing mode, and the content of the register that is written back in **UNKNOWN**. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

LDMDA/LDMFA

For a description of this instruction and the encoding, see *LDMDA/LDMFA* on page F7-2628.

CONSTRAINED UNPREDICTABLE behavior

For the A1 encoding:

- If `BitCount(registers) < 1`, then one of the following behaviors can occur:
  - The instruction is undefined.
  - The instruction executes as a NOP.
  - The instruction operates as an `LDM` with the same addressing mode, but targeting an unspecified set of registers. These registers might include R15.

- If `wback && registers<n> == '1'`, then one of the following behaviors can occur:
  - The instruction is **UNDEFINED**.
  - The instruction executes as a NOP.
  - The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back in **UNKNOWN**. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

LDMIB/LDMED

For a description of this instruction and the encoding, see *LDMIB/LDMED* on page F7-2632.

CONSTRAINED UNPREDICTABLE behavior

For the A1 encoding:

- If `BitCount(registers) < 1`, then one of the following behaviors can occur:
  - The instruction is undefined.
  - The instruction executes as a NOP.
  - The instruction operates as an `LDM` with the same addressing mode, but targeting an unspecified set of registers. These registers might include R15.

- If `wback && registers<n> == '1'`, then one of the following behaviors can occur:
  - The instruction is **UNDEFINED**.
  - The instruction executes as a NOP.
Appendix A Architectural Constraints on UNPREDICTABLE behaviors

A.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is \text{UNKNOWN}. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

**LDMDB/LDMEA**

For a description of this instruction and the encoding, see \textit{LDMDB/LDMEA} on page F7-2630.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If \text{wback} \& \text{registers} = '1', then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the loads using the specified addressing mode and the content of the register that is written back is \text{UNKNOWN}. In addition, if an exception occurs during such as instruction, the base address might be corrupted so that the instruction cannot be repeated.

For the A1 encoding:

- If \text{BitCount(registers)} < 1, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction operates as an \text{LDM} with the same addressing mode, but targeting an unspecified set of registers. These registers might include \text{R15}.

For the T1 encoding:

- If \text{BitCount(registers)} < 2, one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction loads a single register using the specified addressing modes.
  - The instruction operates as an \text{LDM} with the same addressing mode, but targeting an unspecified set of registers. These registers might include \text{R15}.

- If hw2[13] is set to 1, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the loads using the specified addressing mode, but \text{R13} is \text{UNKNOWN}.

\begin{itemize}
  \item Note
  \end{itemize}

This is an exception to the requirements described in \textit{SBZ or SBO fields in instructions} on page AppxA-4760.

- If \text{P} = ‘1’ \& \text{M} = ‘1’, then one of the following behaviors can occur:
  - The instruction is undefined.
  - The instruction executes as a NOP.
  - The instruction loads the register list and either \text{R14} or \text{R15}, both \text{R14} and \text{R15}, or neither of these registers.

**LDR (immediate, T32)**

For a description of this instruction and the encoding, see \textit{LDR (immediate, T32)} on page F7-2634.
CONSTRANDED UNPREDICTABLE behavior

For the T4 encoding:

- If \( w_{\text{back}} \) \&\& \( n = t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

LDR (immediate, A32)

For a description of this instruction and the encoding, see LDR (immediate, A32) on page F7-2636.

CONSTRANDED UNPREDICTABLE behavior

For the A1 encoding:

- If \( w_{\text{back}} \) \&\& \( n = t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

LDR (register, A32)

For a description of this instruction and the encoding, see LDR (register, A32) on page F7-2642.

CONSTRANDED UNPREDICTABLE behavior

For the A1 encoding:

- If \( w_{\text{back}} \) \&\& \( n = t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

LDRB (immediate, T32)

For a description of this instruction and the encoding, see LDRB (immediate, T32) on page F7-2644.

CONSTRANDED UNPREDICTABLE behavior

For the T3 encoding:

- If \( w_{\text{back}} \) \&\& \( n = t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.
LDRB (immediate, A32)
For a description of this instruction and the encoding, see LDRB (immediate, A32) on page F7-2646.

**CONSTRAINED UNPREDICTABLE behavior**
For the A1 encoding:

- If wback && n == t, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such instruction, the base register might be corrupted so that the instruction cannot be repeated.

LDRB (register)
For a description of this instruction and the encoding, see LDRB (register) on page F7-2650.

**CONSTRAINED UNPREDICTABLE behavior**
For the A1 encoding:

- If wback && n == t, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such instruction, the base register might be corrupted so that the instruction cannot be repeated.

LDRBT
For a description of this instruction and the encoding, see LDRBT on page F7-2652.

**CONSTRAINED UNPREDICTABLE behavior**
For the A1 and A2 encoding:

- If wback && n == t, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such instruction, the base register might be corrupted so that the instruction cannot be repeated.

Note
Pre-indexed and post-indexed addressing implies writeback.

- When the Rn field specifies R15, then this instruction can be treated either as described in this section or as described in LDRB (literal) on page AppxA-4713.

LDRH (immediate, T32)
For a description of this instruction and the encoding, see LDRH (immediate, T32) on page F7-2664.
CONSTRUED UNPREDICTABLE behavior

For the T3 encoding:

- If \( wback \&\& \ n = t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

LDRH (immediate, A32)

For a description of this instruction and the encoding, see LDRH (immediate, A32) on page F7-2666.

CONSTRUED UNPREDICTABLE behavior

For the A1 encoding:

- If \( wback \&\& \ n = t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

LDRH (register)

For a description of this instruction and the encoding, see LDRH (register) on page F7-2670.

CONSTRUED UNPREDICTABLE behavior

For the A1 encoding:

- If \( wback \&\& \ n = t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

LDRHT

For a description of this instruction and the encoding, see LDRHT on page F7-2672.

CONSTRUED UNPREDICTABLE behavior

For the A1 and A2 encoding:

- If \( wback \&\& \ n = t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.
Note

Pre-indexed and post-indexed addressing implies writeback.

- When the Rn field specifies R15, then this instruction can be treated either as described in this section or as described in LDRH (literal) on page AppxA-4714.

**LDRSB (immediate)**

For a description of this instruction and the encoding, see LDRSB (immediate) on page F7-2674.

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 encoding:

- If wback && n == t, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

**LDRSB (register)**

For a description of this instruction and the encoding, see LDRSB (register) on page F7-2678.

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 encoding:

- If wback && n == t, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

**LDRSBT**

For a description of this instruction and the encoding, see LDRSBT on page F7-2680.

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 and A2 encoding:

- If wback && n == t, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.
Note

Pre-indexed and post-indexed addressing implies writeback.

• When the Rn field specifies R15, then this instruction can be treated either as described in this section or as described in LDRSB (literal) on page AppxA-4714.

LDRSH (immediate)

For a description of this instruction and the encoding, see LDRSH (immediate) on page F7-2682.

CONSTRAINED UNPREDICTABLE behavior

For the T2 and A1 encoding:

• If \( wback \land n = t \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

LDRSH (register)

For a description of this instruction and the encoding, see LDRSH (register) on page F7-2686.

CONSTRAINED UNPREDICTABLE behavior

For the A1 encoding:

• If \( wback \land n = t \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

LDRSHT

For a description of this instruction and the encoding, see LDRSHT on page F7-2688.

For the A1 and A2 encoding:

• If \( wback \land n = t \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such as instruction, the base register might be corrupted so that the instruction cannot be repeated.

Note

Pre-indexed and post-indexed addressing implies writeback.

• When the Rn field specifies R15, then this instruction can be treated either as described in this section or as described in LDRSB (literal) on page AppxA-4714.
Appendix A Architectural Constraints on UNPREDICTABLE behaviors
A.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

LDRT
For a description of this instruction and the encoding, see LDRT on page F7-2690.
For the A1 and A2 encoding:

• If \( w_{\text{back}} \) \& \( n = t \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs all the loads using the specified addressing mode and the content of the
    register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction,
    the base register might be corrupted so that the instruction cannot be repeated.

  ______ Note _______
Pre-indexed and post-indexed addressing implies writeback.

  ______

• When the Rn field specifies R15, then this instruction can be treated either as described in this section or as
  described in LDRSB (literal) on page AppxA-4714.

LDR (literal)
For a description of this instruction and the encoding, see LDR (literal) on page F7-2638.

CONSTRAINED UNPREDICTABLE behavior
For the A1 encoding:

• If \( \text{bit}[24] \) has the same value as \( \text{bit}[21] \):
  — The instruction is UNDEFINED.
  — The instruction is treated as a NOP.
  — The instruction is treated as if \( \text{bit}[24] \) had value of 1 and \( \text{bit}[21] \) had a value of 0.
  — The instruction treats \( \text{bit}[24] \) as the P bit, and \( \text{bit}[21] \) as the writeback bit, and uses the same addressing
    mode as described in the immediate offset instruction. If this results in writeback to the PC, then the
    requirements described in Using R15 on page AppxA-4760 apply.

  ______ Note _______
This is an exception to the principle in SBZ or SBO fields in instructions on page AppxA-4760.

  ______

• If \( \text{bit}[24] = 0 \) and \( \text{bit}[21] = 1 \), then the instruction can be handled according to the requirements described
  in SBZ or SBO fields in instructions on page AppxA-4760 or the requirements described in LDR (immediate,
  T32) on page AppxA-4707.

LDRB (literal)
For a description of this instruction and the encoding, see LDRB (literal) on page F7-2648.

CONSTRAINED UNPREDICTABLE behavior
For the A1 encoding:

• If \( \text{bit}[24] \) has the same value as \( \text{bit}[21] \):
  — The instruction is UNDEFINED.
  — The instruction is treated as a NOP.
  — The instruction is treated as if \( \text{bit}[24] \) had value of 1 and \( \text{bit}[21] \) had a value of 0.
— The instruction treats bit[24] as the P bit, and bit[21] as the writeback bit, and uses the same addressing
mode as described in the immediate offset instruction. If this results in writeback to the PC, then the
requirements described in Using R15 on page AppxA-4760 apply.

—— Note ———
This is an exception to the principle in SBZ or SBO fields in instructions on page AppxA-4760.

• If bit[24] == 0 and bit[21] == 1, then the instruction can be handled according to the requirements described
in SBZ or SBO fields in instructions on page AppxA-4760 or the requirements described in LDRB
(immediate, T32) on page AppxA-4708.

LDRH (literal)
For a description of this instruction and the encoding, see LDRH (literal) on page F7-2668.

CONSTRANGED UNPREDICTABLE behavior
For the A1 encoding:

• If bit[24] has the same value as bit[21]:
  — The instruction is UNDEFINED.
  — The instruction is treated as a NOP.
  — The instruction is treated as if bit[24] had value of 1 and bit[21] had a value of 0.
  — The instruction treats bit[24] as the P bit, and bit[21] as the writeback bit, and uses the same addressing
    mode as described in the immediate offset instruction. If this results in writeback to the PC, then the
    requirements described in Using R15 on page AppxA-4760 apply.

—— Note ———
This is an exception to the principle in SBZ or SBO fields in instructions on page AppxA-4760.

• If bit[24] == 0 and bit[21] == 1, then the instruction can be handled according to the requirements described
in SBZ or SBO fields in instructions on page AppxA-4760 or the requirements described in LDRH
(immediate) on page AppxA-4709.

LDRSB (literal)
For a description of this instruction and the encoding, see LDRSB (literal) on page F7-2676.

CONSTRANGED UNPREDICTABLE behavior
For the A1 encoding:

• If bit[24] has the same value as bit[21]:
  — The instruction is UNDEFINED.
  — The instruction is treated as a NOP.
  — The instruction is treated as if bit[24] had value of 1 and bit[21] had a value of 0.
  — The instruction treats bit[24] as the P bit, and bit[21] as the writeback bit, and uses the same addressing
    mode as described in the immediate offset instruction. If this results in writeback to the PC, then the
    requirements described in Using R15 on page AppxA-4760 apply.

—— Note ———
This is an exception to the principle in SBZ or SBO fields in instructions on page AppxA-4760.

• If bit[24] == 0 and bit[21] == 1, then the instruction can be handled according to the requirements described
in SBZ or SBO fields in instructions on page AppxA-4760 or the requirements described in LDRSB
(immediate) on page AppxA-4711.
Appendix A Architectural Constraints on UNPREDICTABLE behaviors
A.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

LDRSH (literal)
For a description of this instruction and the encoding, see LDRSH (literal) on page F7-2684.

CONSTRANDED UNPREDICTABLE behavior
For the A1 encoding:

• If bit[24] has the same value as bit[21]:
  — The instruction is UNDEFINED.
  — The instruction is treated as a NOP.
  — The instruction is treated as if bit[24] had value of 1 and bit[21] had a value of 0.
  — The instruction treats bit[24] as the P bit, and bit[21] as the writeback bit, and uses the same addressing
    mode as described in the immediate offset instruction. If this results in writeback to the PC, then the
    requirements described in Using R15 on page AppxA-4760 apply.
    
    —— Note ——
    This is an exception to the principle in SBZ or SBO fields in instructions on page AppxA-4760.

• If bit[24] == 0 and bit[21] == 1, then the instruction can be handled according to the requirements described
  in SBZ or SBO fields in instructions on page AppxA-4760 or the requirements described in LDRSH
  (immediate) on page AppxA-4712.

LDRD (immediate)
For a description of this instruction and the encoding, see LDRD (immediate) on page F7-2654.

CONSTRANDED UNPREDICTABLE behavior
For all encodings:

• If wback && (n == t || n == t2), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs all the loads using the specified addressing mode and the content of the
    register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction,
    the base address might be corrupted so that the instruction cannot be repeated.

For the T1 encoding:

• If t == t2, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs all of the loads using the specified addressing mode and the register that is
    loaded takes an UNKNOWN value.

For the A1 encoding:

• If P=='0' && W=='1’ then one of the following behaviors can occurs:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction behaves as if the values of P and W were as follows:
    P == '1’ && W == ‘0’
    P == '1’ && W == ‘1’
    P == '0’ && W == ‘0’
• If \( R_t<0> == '1' \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The behavior is the same as if \( R_t<0> == '0' \).
  — The register accessed are both specified by \( R_t \). This means that \( R_t \) and \( R_t+1 \) are the same, and both have \( b[0] == 1 \).
  — The registers accessed are specified by \( R_t \) and \( R_t+1 \).

  Note
  This does not apply if \( R_t == '1111' \).

LDRD (register)

For a description of this instruction and the encoding, see LDRD (register) on page F7-2658.

CONSTRANDED UNPREDICTABLE behavior

For the A1 encoding:
• If \( wback \&\& (n == t \| n == t2) \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs all the loads using the specified addressing mode and the content of the register that is written back is UNKNOWN. In addition, if an exception occurs during such an instruction, the base address might be corrupted so that the instruction cannot be repeated.

• If \( P == '0' \&\& W == '1' \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction behaves as if the values of \( P \) and \( W \) were as follows:
    - \( P == '1' \&\& W == '0' \)
    - \( P == '1' \&\& W == '1' \)
    - \( P == '0' \&\& W == '0' \)

• If \( m == t \| m == t2 \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction is treated as a NOP.
  — The instruction loads register \( R_m \) with an UNKNOWN value.

• If \( R_t<0> == '1' \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The behavior is the same as if \( R_t<0> == '0' \).
  — The registers accessed are both specified by \( R_t \). This means that \( R_t \) and \( R_t+1 \) are the same, and in both cases \( b[0] == 1 \).
  — The registers accessed are specified by \( R_t \) and \( R_t+1 \).

  Note
  This does not apply if \( R_t == '1111' \).
LDRD (literal)

For a description of this instruction and the encoding, see LDRD (literal) on page F7-2656.

CONSTRANGED UNPREDICTABLE behavior

For the A1 encoding:

- If bit[24] and bit[21] do not have their should be values, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction is treated as if the bits had their should be values.

- If Rt<0>=='1', then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The behavior is the same as if Rt<0>=='0'.
  - The registers accessed are both specified by Rt. This means that Rt and Rt+1 are the same, and both have bit[0] equal to 1.
  - The registers accessed are specified by Rt and Rt+1.

    Note

    This does not apply if Rt=='1111'.

For the T1 encoding:

- If t == t2, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the loads using the specified addressing mode and the register that is loaded takes an UNKNOWN value.

- If W == '1', then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction is treated as if W == '0'.
  - The instruction uses the P and W bits as described for LDRD (immediate) on page AppxA-4715.

LDREX

For a description of this instruction and the encoding, see LDREX on page F7-2660.

CONSTRANGED UNPREDICTABLE behavior

If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

LDREXH

For a description of this instruction and the encoding, see LDREXH on page F7-2663.

CONSTRANGED UNPREDICTABLE behavior

If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.
LDREXB
For a description of this instruction and the encoding, see "LDREXB on page F7-2661."

CONSTRAINED UNPREDICTABLE behavior
If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

LDAEX
For a description of this instruction and the encoding, see "LDAEX on page F7-2614."

CONSTRAINED UNPREDICTABLE behavior
If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

LDAEXH
For a description of this instruction and the encoding, see "LDAEXH on page F7-2617."

CONSTRAINED UNPREDICTABLE behavior
If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

LDAEXB
For a description of this instruction and the encoding, see "LDAEXB on page F7-2615."

CONSTRAINED UNPREDICTABLE behavior
If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

LDREXD
For a description of this instruction and the encoding, see "LDREXD on page F7-2662."

CONSTRAINED UNPREDICTABLE behavior
For all encodings:

• If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

For the T1 encoding:

• If $t = t_2$, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs all of the loads using the specified addressing mode and the register that is loaded takes an UNKNOWN value.

For the A1 encoding:

• If $rt<5>$='1', then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
A.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

For all encodings:

- If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

For the T1 encoding:

- If \( t = t_2 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the loads using the specified addressing mode and the register that is loaded takes an UNKNOWN value.

For the A1 encoding:

- If \( \text{Rt}0 == '1' \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The registers accessed are both specified by \( \text{Rt} \). This means that \( \text{Rt} \) and \( \text{Rt}+1 \) are the same, and both have bit[0] == 1.
  - The registers accessed are specified by \( \text{Rt} \) and \( \text{Rt}+1 \).

Note

If \( t_2 = 15 \), then the requirements described in Using R15 on page AppxA-4760 apply.

LDAEXD

For a description of this instruction and the encoding, see LDAEXD on page F7-2616.

CONSTRAINED UNPREDICTABLE behavior

For all encodings:

- If the Load-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

For the T1 encoding:

- If \( t = t_2 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the loads using the specified addressing mode and the register that is loaded takes an UNKNOWN value.

For the A1 encoding:

- If \( \text{Rt}0 == '1' \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The registers accessed are both specified by \( \text{Rt} \). This means that \( \text{Rt} \) and \( \text{Rt}+1 \) are the same, and both have bit[0] == 1.
  - The registers accessed are specified by \( \text{Rt} \) and \( \text{Rt}+1 \).

Note

If \( t_2 = 15 \), then the requirements described in Using R15 on page AppxA-4760 apply.

MOV (register, T32)

For a description of this instruction and the encoding, see MOV (register, T32) on page F7-2710.

CONSTRAINED UNPREDICTABLE behavior

For the T2 encoding:

- If \( \text{InITBlock}() \), then one of the following behaviors can occur:
  - The instruction generates an UNDEFINED exception.
  - The instruction is executed as if it passed its condition code check.
  - The instruction executes as a NOP. That is, it behaves as if it failed its condition code check.
  - The instruction is treated as MOV Rd, Rm.
Note

This is an exception to the general behavior described in CONSTRAINED UNPREDICTABLE behavior in an IT block on page AppxA-4761.

MRRC, MRRC2

For a description of this instruction and the encoding, see MRRC, MRRC2 on page F7-2718.

CONSTRAINED UNPREDICTABLE behavior

For all encodings:

- If $t = t_2$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The register that is transferred takes an UNKNOWN value.

MSR (register)

For a description of this instruction and the encoding, see MSR (register) on page F7-2724.

CONSTRAINED UNPREDICTABLE behavior

For all encodings:

- If mask == '00', then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.

POP (T32)

For a description of this instruction and the encoding, see POP (T32) on page F7-2756.

CONSTRAINED UNPREDICTABLE behavior

For the T1 encoding:

- If BitCount(registers) < 1, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction operates as a POP with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

For the T2 encoding:

- If BitCount(registers) < 2, one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction loads a single register using the specified addressing modes.
  - The instruction operates as an LDM with the same addressing mode but targeting an unspecified set of registers. These might include R15.

- If hw2 bit[13] is set to 1, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
Appendix A Architectural Constraints on UNPREDICTABLE behaviors
A.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

— The instruction performs all of the loads using the specified addressing mode but R13 in UNKNOWN.
In addition, if an exception occurs during such an instruction, the base address might be corrupted so
that the instruction cannot be repeated.

——— Note ————
This is an exception to the requirements described in SBZ or SBO fields in instructions on
page AppxA-4760.

• If P == ‘1’ && M == ‘1’, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction loads the register list and either R14 or R15, both R14 and R15, or neither of these
    registers.

For the T3 encoding:

• If t == 13, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs the load using the specified addressing mode but R15 is UNKNOWN.

——— Note ————
This is an exception to the requirements described in Using R13 on page AppxA-4759.

POP (A32)

For a description of this instruction and the encoding, see POP (A32) on page F7-2758.

CONSTRANDED UNPREDICTABLE behavior

For the A1 encoding:

• If bit[13] is set to 1, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs all of the loads using the specified addressing mode but R13 is UNKNOWN.
In addition, if an exception occurs during such an instruction, the base address might be corrupted so
that the instruction cannot be repeated.

For the A2 encoding:

• If t == 13, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs the load using the specified addressing mode but R15 is UNKNOWN.

——— Note ————
This is an exception to the requirements described in Using R13 on page AppxA-4759.

PUSH

For a description of this instruction and the encoding, see PUSH on page F7-2760.
CONSTRAINED UNPREDICTABLE behavior

For the T1 encoding:

- If BitCount(registers) < 1, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction operates as a PUSH with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

For the T2 encoding:

- If BitCount(registers) < 2, one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction stores a single register using the specified addressing modes.
  - The instruction operates as a PUSH with the same addressing mode but targeting an unspecified set of registers. These might include R15.

- If hw2 bit[13] is set, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the stores using the specified addressing mode but R13 is UNKNOWN.

  **Note**
  This is an exception to the requirements described in SBZ or SBO fields in instructions on page AppxA-4760.

- If hw2 bit[15] is set to 1, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the stores using the specified addressing mode, but R15 is UNKNOWN.

RBIT

For a description of this instruction and the encoding, see **RBIT on page F7-2772**.

CONSTRAINED UNPREDICTABLE behavior

For the T1 encoding:

- If ! Consistent(Rm), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The register specified by Rm in halfword 1 is used as the source register.
  - The register specified by Rm in halfword 2 is used as the source register.
  - The value in the destination register is UNKNOWN.

REV

For a description of this instruction and the encoding, see **REV on page F7-2773**.
CONSTRAINED UNPREDICTABLE behavior

For the T2 encoding:

- If \( \text{! Consistent(Rm)} \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The register specified by Rm in halfword 1 is used as the source register.
  - The register specified by Rm in halfword 2 is used as the source register.
  - The value in the destination register is UNKNOWN.

REV16

For a description of this instruction and the encoding, see REV16 on page F7-2774.

CONSTRAINED UNPREDICTABLE behavior

For the T2 encoding:

- If \( \text{! Consistent(Rm)} \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The register specified by Rm in halfword 1 is used as the source register.
  - The register specified by Rm in halfword 2 is used as the source register.
  - The value in the destination register is UNKNOWN.

REVSH

For a description of this instruction and the encoding, see REVSH on page F7-2775.

CONSTRAINED UNPREDICTABLE behavior

For the T2 encoding:

- If \( \text{! Consistent(Rm)} \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The register specified by Rm in halfword 1 is used as the source register.
  - The register specified by Rm in halfword 2 is used as the source register.
  - The value in the destination register is UNKNOWN.

SBFX

For a description of this instruction and the encoding, see SBFX on page F7-2798.

CONSTRAINED UNPREDICTABLE behavior

For all encodings:

- If \( \text{msb}t > 31 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The output value in the register is UNKNOWN.

UBFX

For a description of this instruction and the encoding, see UBFX on page F7-2960.
**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If `msbt > 31`, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The output value in the register is UNKNOWN.

**SDIV**

For a description of this instruction and the encoding, see *SDIV on page F7-2800*.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If halfword 2 bits[15:12] != ‘1111’, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs a divide with no side-effects on other registers.
  - The instruction performs a divide and the register specified by bits[15:12] becomes UNKNOWN.

--- **Note**

This is an exception to the requirements described in *SBZ or SBO fields in instructions on page AppxA-4760*.

**UDIV**

For a description of this instruction and the encoding, see *UDIV on page F7-2964*.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If halfword 2 bits[15:12] != ‘1111’, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs a divide with no side-effects on other registers.
  - The instruction performs a divide and the register specified by bits[15:12] becomes UNKNOWN.

--- **Note**

This is an exception to the requirements described in *SBZ or SBO fields in instructions on page AppxA-4760*.

**SMULL**

For a description of this instruction and the encoding, see *SMULL on page F7-2838*.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If `dHi == dLo`, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The target register takes an UNKNOWN value.
SMLAL
For a description of this instruction and the encoding, see SMLAL on page F7-2816.

CONSTRANGED UNPREDICTABLE behavior
For all encodings:
• If dHi == dLo, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The target register takes an UNKNOWN value.

SMLALBB, SMLALBT, SMLALTB, SMLALTT
For a description of this instruction and the encoding, see SMLALBB, SMLALBT, SMLALTB, SMLALTT on page F7-2818.

CONSTRANGED UNPREDICTABLE behavior
For all encodings:
• If dHi == dLo, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The target register takes an UNKNOWN value.

SMLALD
For a description of this instruction and the encoding, see SMLALD on page F7-2820.

CONSTRANGED UNPREDICTABLE behavior
For all encodings:
• If dHi == dLo, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The target register takes an UNKNOWN value.

SMLS LD
For a description of this instruction and the encoding, see SMLSD on page F7-2826.

CONSTRANGED UNPREDICTABLE behavior
For all encodings:
• If dHi == dLo, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The target register takes an UNKNOWN value.

UMULL
For a description of this instruction and the encoding, see UMULL on page F7-2982.
**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If $d_{hi} == d_{lo}$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The target register takes an UNKNOWN value.

**UMAAL**

For a description of this instruction and the encoding, see *UMAAL on page F7-2978.*

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If $d_{hi} == d_{lo}$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The target register takes an UNKNOWN value.

**UMLAL**

For a description of this instruction and the encoding, see *UMLAL on page F7-2980.*

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If $d_{hi} == d_{lo}$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The target register takes an UNKNOWN value.

**STC, STC2**

For a description of this instruction and the encoding, see *STC, STC2 on page F7-2854.*

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If $n == 15$ and (wback || CurrentInstrSet() != InstrSet_A32), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction operates without writeback.

________ Note __________

This is consistent with ignoring writes to the PC.

The instruction set uses the addressing mode described in the equivalent immediate offset instruction. If this results in writewback to the PC, then the requirements described in *Using R15 on page AppxA-4760* apply.

For the T1 and T2 encoding:

- The value used by stores using R15 as a base register follows the requirements described in *Using R15 on page AppxA-4760.*
Appendix A Architectural Constraints on UNPREDICTABLE behaviors
A.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

STM (STMIA, STMEA)

For a description of this instruction and the encoding, see STM (STMIA, STMEA) on page F7-2870.

CONSTRAINED UNPREDICTABLE behavior

For all encodings:

- The value used by stores using R15 as a base register follow the requirements described in Using R15 on page AppxA-4760.

For the T1 and A1 encoding:

- If $\text{BitCount}(\text{registers}) < 1$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

For the T2 encoding:

- If $\text{BitCount}(\text{registers}) < 2$, then one of the following behaviors occurs:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction stores a single register using the specified addressing modes.
  - The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These might include R15.

- If hw2 bit[13] is set, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all the stores using the specified addressing mode but the value of R13 is UNKNOWN.

  ___ Note ___
  This is an exception to the requirements described in SBZ or SBO fields in instructions on page AppxA-4760.

- If hw2 bit[15] is set to 1, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the stores using the specified addressing mode but the value of R15 is UNKNOWN.

  ___ Note ___
  This is an exception to the requirements described in SBZ or SBO fields in instructions on page AppxA-4760.

- If wback && registers<n> == ’1’, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs all of the stores using the specified addressing mode and the value stored for the base register is UNKNOWN.

STMDA (STMED)

For a description of this instruction and the encoding, see STMDA (STMED) on page F7-2872.
CONSTRAINED UNPREDICTABLE behavior

For the A1 encoding:

• If $\text{BitCount}(\text{registers}) < 1$, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

• The value used by stores using R15 as a base register follow the requirements described in Using R15 on page AppxA-4760.

STMIB (STMFA)

For a description of this instruction and the encoding, see STMIB (STMFA) on page F7-2876.

CONSTRAINED UNPREDICTABLE behavior

For the A1 encoding:

• If $\text{BitCount}(\text{registers}) < 1$, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

• The value used by stores using R15 as a base register follow the requirements described in Using R15 on page AppxA-4760.

STMDB (STMFD)

For a description of this instruction and the encoding, see STMDB (STMFD) on page F7-2874.

CONSTRAINED UNPREDICTABLE behavior

For all encodings:

• The value used by stores using R15 as a base register follow the requirements described in Using R15 on page AppxA-4760.

For the A1 encoding:

• If $\text{BitCount}(\text{registers}) < 1$, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

For the T1 encoding:

• If $\text{wback} \& \text{ registers} < 2$, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction stores a single register using the specified addressing mode.
  — The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These might include R15.

• If $\text{wback} \& \text{ registers} < 2$, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
— The instruction executes as a NOP.
— The instruction performs all of the stores using the specified addressing mode and the value stored for the base register is UNKNOWN.

• If hw2 bit[13] is set to 1, then one of the following behaviors occurs:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs all of the stores using the specified addressing mode but the value of R13 is UNKNOWN.

  Note
  This an exception to the requirements described in SBZ or SBO fields in instructions on page AppxA-4760.

• If hw2 bit[15] is set to 1, then one of the following behaviors occurs:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs all of the stores using the specified addressing mode but the value of R15 is UNKNOWN.

  Note
  This is an exception to the requirement described in SBZ or SBO fields in instructions on page AppxA-4760.

STR (immediate, T32)
For a description of this instruction and the encoding, see STR (immediate, T32) on page F7-2878.

CONSTRAINED UNPREDICTABLE behavior
For the T3 encoding:
  • If t == 15 is UNPREDICTABLE, then one of the following behaviors can occur:
    — The instruction is UNDEFINED.
    — The instruction executes as a NOP.
    — The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.
  • The value used by stores using R15 as a base register follow the requirements described in Using R15 on page AppxA-4760.

For the T4 encoding:
  • If wback && n == t, then one of the following behaviors can occur:
    — The instruction is UNDEFINED.
    — The instruction executes as a NOP.
    — The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.
  • If wback && n == 15, then one of the following behaviors can occur:
    — The instruction is UNDEFINED.
    — The instruction executes as a NOP.
    — The store instruction operates without writeback.
Appendix A Architectural Constraints on UNPREDICTABLE behaviors

Appendix A Architectural Constraints on UNPREDICTABLE behaviors

A.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

STR (register)

For a description of this instruction and the encoding, see STR (register) on page F7-2882.

CONSTRAINED UNPREDICTABLE behavior

For the T2 encoding:

- If \( t = 15 \) is UNPREDICTABLE, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

- The value used by stores using R15 as a base register follow the requirements described in Using R15 on page AppxA-4760.

For the A1 encoding:

- If \( \text{wback} \land n = t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.

- If \( \text{wback} \land n = 15 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction operates without writeback.

  \[ \text{Note} \]
  This is consistent with ignoring writes to the PC.

  \[ \text{Note} \]
  The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in Using R15 on page AppxA-4760 apply.

  \[ \text{Note} \]
  Pre-indexed and post-indexed addressing implies writeback.

- The value used by stores using R15 as a base register follow the requirements described in Using R15 on page AppxA-4760.

STRB (immediate, T32)

For a description of this instruction and the encoding, see STRB (immediate, T32) on page F7-2884.

CONSTRAINED UNPREDICTABLE behavior

For the T3 encoding:

- If \( t = 15 \) is UNPREDICTABLE, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
— The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

• If wback && n == t, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.

• If wback && n == 15, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

—— Note ———
This is consistent with ignoring writes to the PC.

—— Note ———
The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in Using R15 on page AppxA-4760 apply.

—— Note ———
Pre-indexed and post-indexed addressing implies writeback.

• The value used by stores using R15 as a base register follow the requirements described in Using R15 on page AppxA-4760.

STRB (immediate, A32)

For a description of this instruction and the encoding, see STRB (immediate, A32) on page F7-2886.

CONstrained UNPREDICTABLE behavior

For the A1 encoding:

• If t == 15 is UNPREDICTABLE, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

• If wback && n == t, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.

• If wback && n == 15, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction operates without writeback.

—— Note ———
This is consistent with ignoring writes to the PC.
A.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

--- Note ---
Pre-indexed and post-indexed addressing implies writeback.

- The value used by stores using R15 as a base register follow the requirements described in Using R15 on page AppxA-4760.

**STRB (register)**

For a description of this instruction and the encoding, see STRB (register) on page F7-2888.

**CONSTRANDED UNPREDICTABLE behavior**

For the A1 and T2 encoding:

- If \( t = 15 \) is UNPREDICTABLE, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

For the A1 encoding:

- If \( wback && n = t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.

- If \( wback && n = 15 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction operates without writeback.

--- Note ---
This is consistent with ignoring writes to the PC.

--- Note ---
Pre-indexed and post-indexed addressing implies writeback.

- The value used by stores using R15 as a base register follow the requirements described in Using R15 on page AppxA-4760.

**STRBT**

For a description of this instruction and the encoding, see STRBT on page F7-2890.
CONSTRANGED UNPREDICTABLE behavior

For all encodings:

- If \( t = 15 \) is UNPREDICTABLE, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

- The value used by stores using R15 as a base register follow the requirements described in *Using R15 on page AppxA-4760*.

For the T4 encoding:

- If \( wback \) && \( n = t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.

- If \( wback \) && \( n = 15 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction operates without writeback.

  **Note**
  
  This is consistent with ignoring writes to the PC.

  - The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15 on page AppxA-4760* apply.

  **Note**
  
  Pre-indexed and post-indexed addressing implies writeback.

**STRH (immediate, T32)**

For a description of this instruction and the encoding, see *STRH (immediate, T32)* on page F7-2904.

CONSTRANGED UNPREDICTABLE behavior

For the T3 and T4 encoding:

- If \( t = 15 \) is UNPREDICTABLE, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

- The value used by stores using R15 as a base register follow the requirements described in *Using R15 on page AppxA-4760*.

For the T4 encoding:

- If \( wback \) && \( n = t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
--- The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.

- If wback & n == 15, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction operates without writeback.

  **Note**
  This is consistent with ignoring writes to the PC.

- The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15 on page AppxA-4760* apply.

  **Note**
  Pre-indexed and post-indexed addressing implies writeback.

---

**STRH (Immediate, A32)**

For a description of this instruction and the encoding, see *STRH (Immediate, A32) on page F7-2906.*

**CONSTRAINED UNPREDICTABLE behavior**

For the A1 encoding:

- If t == 15 is UNPREDICTABLE, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

- If wback & n == t, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.

- If wback & n == 15, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction operates without writeback.

  **Note**
  This is consistent with ignoring writes to the PC.

- The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in *Using R15 on page AppxA-4760* apply.

  **Note**
  Pre-indexed and post-indexed addressing implies writeback.

- The value used by stores using R15 as a base register follow the requirements described in *Using R15 on page AppxA-4760.*
STRH (register)

For a description of this instruction and the encoding, see STRH (register) on page F7-2908.

CONSTRAINED UNPREDICTABLE behavior

For the T2 and A1 encoding:

• If \( t = 15 \) is UNPREDICTABLE, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

• The value used by stores using R15 as a base register follow the requirements described in Using R15 on page AppxA-4760.

For the A1 encoding:

• If \( \text{wback} && n == t \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.

• If \( \text{wback} && n == 15 \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction operates without writeback.

      Note
      This is consistent with ignoring writes to the PC.

      — The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in Using R15 on page AppxA-4760 apply.

      Note
      Pre-indexed and post-indexed addressing implies writeback.

STRHT

For a description of this instruction and the encoding, see STRHT on page F7-2910.

CONSTRAINED UNPREDICTABLE behavior

For all encodings:

• If \( t = 15 \) is UNPREDICTABLE, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

• The value used by stores using R15 as a base register follow the requirements described in Using R15 on page AppxA-4760.
For the A1 and A2 encoding:

- If `wback && n == t`, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.

- If `wback && n == 15`, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction operates without writeback.

  Note
  This is consistent with ignoring writes to the PC.

  The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in Using R15 on page AppxA-4760 apply.

  Note
  Pre-indexed and post-indexed addressing implies writeback.

**STRT**

For a description of this instruction and the encoding, see STRT on page F7-2912.

**CONSTRAINED UNPREDICTABLE behavior**

For the T1 encoding:

- If `t == 15` is UNPREDICTABLE, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

For the A1 and A2 encoding:

- If `wback && n == t`, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs the store using the specified addressing mode but the value stored is UNKNOWN.

- If `wback && n == 15`, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction operates without writeback.

  Note
  This is consistent with ignoring writes to the PC.

  The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in Using R15 on page AppxA-4760 apply.
### Note
Pre-indexed and post-indexed addressing implies writeback.

- The value used by stores using R15 as a base register follow the requirements described in Using R15 on page AppxA-4760.

### STRD (Immediate)
For a description of this instruction and the encoding, see STRD (Immediate) on page F7-2892.

### CONSTRAINED UNPREDICTABLE behavior
For all encodings:

- If \( t = 15 \) or \( t2 = 15 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

- If \( \text{wback} \land (n = t \lor n = t2) \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs the store of the registers specified using the specified addressing mode but the value of the registers stored is UNKNOWN.

- The value used by stores using R15 as a base register follow the requirements described in Using R15 on page AppxA-4760.

For the A1 encoding:

- If \( \text{wback} \land n = 15 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction operates without writeback.

### Note
This is consistent with ignoring writes to the PC.

- The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in Using R15 on page AppxA-4760 apply.

### Note
Pre-indexed and post-indexed addressing implies writeback.

- If \( \text{Rt}<0>='1' \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The behavior is the same as if \( \text{Rt}<0>='0' \).
  - The registers accessed are both specified by Rt. For example, Rt and Rt+1 are the same, and both have bit[0] equal to 1.
  - The registers accessed are specified by Rt and Rt+1.
Appendix A Architectural Constraints on UNPREDICTABLE behaviors
A.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

--- Note ---
This does not apply if Rt=='1111'.

---

• If P == '0' && W == '1', then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction is treated as a NOP.
  — The instruction behaves as if the values of P and W were one of:
    P == '1' && W == '0'
    P == '1' && W == '1'
    P == '0' && W == '0'

**STRD (register)**

For a description of this instruction and the encoding, see STRD (register) on page F7-2894.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

• If t2 == 15, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction performs the store using the specified addressing mode but the value corresponding to R15 is UNKNOWN.

• If wback && (n == t || n == t2), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs the store of the registers specified using the specified addressing mode but the value of the registers stored is UNKNOWN.

• The value used by stores using R15 as a base register follow the requirements described in Using R15 on page AppxA-4760.

• If wback && n == 15, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction operates without writeback.

--- Note ---
This is consistent with ignoring writes to the PC.

---

— The instruction uses the addressing mode described in the equivalent immediate offset instruction. If this results in writeback to the PC, then the requirements described in Using R15 on page AppxA-4760 apply.

--- Note ---
Pre-indexed and post-indexed addressing implies writeback.

---

• If Rt<0>=='1', then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The behavior is the same as if Rt<0>=='0'.

---
— The registers accessed are both specified by Rt. For example, Rt and Rt+1 are the same, and both have bit[0] equal to 1.
— The registers accessed are specified by Rt and Rt+1.

**Note**
This does not apply if Rt==’1111’.

- If P == ‘0’ && W == ‘1’, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction is treated as a NOP.
  — The instruction behaves as if the values of P and W were one of:
    - P == ‘1’ && W == ‘0’
    - P == ‘1’ && W == ‘1’
    - P == ‘0’ && W == ‘0’

### STREX

For a description of this instruction and the encoding, see *STREX* on page F7-2896.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If d == t, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction executes, but the value stored is UNKNOWN.

- If d == n, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs the store to an UNKNOWN address.

- If the Store-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

- If the instruction specifies that t2==15, then the requirements described in *Using R15* on page AppxA-4760 apply.

### STREXB

For a description of this instruction and the encoding, see *STREXB* on page F7-2898.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If d == t, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction executes, but the value stored is UNKNOWN.

- If d == n, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs the store to an UNKNOWN address.
• If the Store-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

• If the instruction specifies that \( t2==15 \), then the requirements described in *Using R15 on page AppxA-4760* apply.

**STREXD**

For a description of this instruction and the encoding, see *STREXD on page F7-2900*.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

• If \( d == t \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction executes, but the value stored is UNKNOWN.

• If \( d == n \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs the store to an UNKNOWN address.

• If the Store-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

• If the instruction specifies that \( t2==15 \), then the requirements described in *Using R15 on page AppxA-4760* apply.

For the A1 encoding:

• If \( Rt<0>=='1' \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The behavior is the same as if \( Rt<0>=='0' \).
  — The register accessed are both specified by \( Rt \). For example, \( Rt \) and \( Rt+1 \) are the same, and both have \( bit[0] == 1 \).
  — The registers accessed are specified by \( Rt \) and \( R+1 \).

**STREXH**

For a description of this instruction and the encoding, see *STREXH on page F7-2902*.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

• If \( d == t \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction executes, but the value stored is UNKNOWN.

• If \( d == n \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs the store to an UNKNOWN address.
• If the Store-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

• If the instruction specifies that $t_2 = 15$, then the requirements described in Using R15 on page AppxA-4760 apply.

**STLEX**

For a description of this instruction and the encoding, see STLEX on page F7-2860.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

• If $d = t$, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction executes, but the value stored is UNKNOWN.

• If $d = n$, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs the store to an UNKNOWN address.

• If the Store-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

• If the instruction specifies that $t_2 = 15$, then the requirements described in Using R15 on page AppxA-4760 apply.

**STLEXB**

For a description of this instruction and the encoding, see STLEXB on page F7-2862.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

• If $d = t$, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The store instruction executes, but the value stored is UNKNOWN.

• If $d = n$, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The instruction performs the store to an UNKNOWN address.

• If the Store-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

• If the instruction specifies that $t_2 = 15$, then the requirements described in Using R15 on page AppxA-4760 apply.

**STLEXD**

For a description of this instruction and the encoding, see STLEXD on page F7-2864.
CONSTRANGED UNPREDICTABLE behavior

For all encodings:

- If \( d == t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction executes, but the value stored is UNKNOWN.

- If \( d == n \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs the store to an UNKNOWN address.

- If the Store-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

- If the instruction specifies that \( t2==15 \), then the requirements described in Using R15 on page AppxA-4760 apply.

For the A1 encoding:

- If \( Rt<0>=='1' \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The behavior is the same as if \( Rt<0>=='0' \).
  - The register accessed are both specified by Rt. For example, Rt and R+1 are the same, and both have bit[0] == 1.
  - The registers accessed are specified by Rt and R+1.

STLEXH

For a description of this instruction and the encoding, see STLEXH on page F7-2866.

CONSTRANGED UNPREDICTABLE behavior

For all encodings:

- If \( d == t \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The store instruction executes, but the value stored is UNKNOWN.

- If \( d == n \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction performs the store to an UNKNOWN address.

- If the Store-Exclusive is to any type of Device memory, then the instruction operates as if the access were to Normal memory.

- If the instruction specifies that \( t2==15 \), then the requirements described in Using R15 on page AppxA-4760 apply.

VCVT (between floating-point and fixed-point)

For a description of this instruction and the encoding, see VCVT (between floating-point and fixed-point, floating-point) on page F8-3148.
CONSTRAINED UNPREDICTABLE behavior

For all encodings:

• If frac_bits < 0, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The result of the conversion is UNKNOWN.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

VLD1 (multiple single elements)

For a description of this instruction and the encoding, see VLD1 (multiple single elements) on page F8-3174.

CONSTRAINED UNPREDICTABLE behavior

For all encodings:

• If d+regs > 32, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

VLD1 (single element to all lanes)

For a description of this instruction and the encoding, see VLD1 (single element to all lanes) on page F8-3178.

CONSTRAINED UNPREDICTABLE behavior

For all encodings:

• If d+regs > 32, then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

VLD2 (multiple 2-element structures)

For a description of this instruction and the encoding, see VLD2 (multiple 2-element structures) on page F8-3180.
**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If $d2+\text{regs} > 32$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

**VLD2 (single 2-element structure to one lane)**

For a description of this instruction and the encoding, see *VLD2 (single 2-element structure to one lane)* on page F8-3182.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If $d2 > 31$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

**VLD2 (single 2-element structure to all lanes)**

For a description of this instruction and the encoding, see *VLD2 (single 2-element structure to all lanes)* on page F8-3184.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If $d2 > 31$, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.
VLD3 (multiple 3-element structures)

For a description of this instruction and the encoding, see VLD3 (multiple 3-element structures) on page F8-3186.

CONSTRAINED UNPREDICTABLE behavior

For all encodings:

- If \( d_3 > 31 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

VLD3 (single 3-element structure to one lane)

For a description of this instruction and the encoding, see VLD3 (single 3-element structure to one lane) on page F8-3188.

CONSTRAINED UNPREDICTABLE behavior

For all encodings:

- If \( d_3 > 31 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

VLD3 (single 3-element structure to all lanes)

For a description of this instruction and the encoding, see VLD3 (single 3-element structure to all lanes) on page F8-3190.

CONSTRAINED UNPREDICTABLE behavior

For all encodings:

- If \( d+\text{regs} > 32 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.
VLD4 (multiple 4-element structures)

For a description of this instruction and the encoding, see *VLD4 (multiple 4-element structures)* on page F8-3192.

**CONSTRAINED UNPREDICTABLE behavior**

If \( d_3 > 31 \), then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

VLD4 (single 4-element structure to one lane)

For a description of this instruction and the encoding, see *VLD4 (single 4-element structure to one lane)* on page F8-3194.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If \( d_4 > 31 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

VLD4 (single 4-element structure to all lanes)

For a description of this instruction and the encoding, see *VLD4 (single 4-element structure to all lanes)* on page F8-3196.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If \( d_4 > 31 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - One or more of the SIMD and floating-point registers are UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.
VLDM

For a description of this instruction and the encoding, see VLDM on page F8-3198.  

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If `regs` == 0, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction operates as a VLDM or a VPOP with the same addressing mode but loads no registers.

- If the register list includes a register that is out of range, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - One or more of the SIMD&FP registers become UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

--- Note ---

Out of range means that the register list includes:

- A register with a number greater than the number of registers implemented.
- More than 16 double word registers.
- A double word register greater than D16 with an odd value of `imm8`.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

VPOP

For a description of this instruction and the encoding, see VPOP on page F8-3268.  

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If `regs` == 0, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction operates as a VLDM or a VPOP with the same addressing mode but loads no registers.

- If the register list includes a register that is out of range, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - One or more of the SIMD&FP registers become UNKNOWN. If the instruction specifies writeback, the base register becomes UNKNOWN. This behavior does not affect any general-purpose registers.

--- Note ---

Out of range means that the register list includes:

- A register with a number greater than the number of registers implemented.
- More than 16 double word registers.
- A double word register greater than D16 with an odd value of `imm8`.
If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

**VMOV (between two general-purpose registers and two single-precision registers)**

For a description of this instruction and the encoding, see *VMOV (between two general-purpose registers and two single-precision registers)* on page F8-3224.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If `to_arm_registers && t == t2`, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The destination register becomes UNKNOWN.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

- If `n == 31`, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - One or more of the SIMD&FP single-precision registers become UNKNOWN for a move to the single-precision register. The general-purpose registers listed in the instruction become UNKNOWN for a move from the single-precision registers. This behavior does not affect any other general-purpose registers.

**VMOV (between two general-purpose registers and a doubleword extension register)**

For a description of this instruction and the encoding, see *VMOV (between two general-purpose registers and a doubleword extension register)* on page F8-3226.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If `to_arm_registers && t == t2`, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The destination register becomes UNKNOWN.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

**VST1 (multiple single elements)**

For a description of this instruction and the encoding, see *VST1 (multiple single elements)* on page F8-3356.
**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If \( d+\text{regs} > 32 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register become unknown. This behavior does not affect any other memory locations.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD\&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

**VST2 (multiple 2-element structures)**

For a description of this instruction and the encoding, see *VST2 (multiple 2-element structures)* on page F8-3360.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If \( d2+\text{regs} > 32 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register become unknown. This behavior does not affect any other memory locations.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD\&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

**VST2 (single 2-element structure from one lane)**

For a description of this instruction and the encoding, see *VST2 (single 2-element structure from one lane)* on page F8-3362.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If \( d2 > 31 \), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register become unknown. This behavior does not affect any other memory locations.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD\&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.
VST3 (multiple 3-element structures)
For a description of this instruction and the encoding, see VST3 (multiple 3-element structures) on page F8-3364.

CONSTRANGED UNPREDICTABLE behavior
For all encodings:

• If \( d_3 > 31 \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register become unknown. This behavior does not affect any other memory locations.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRANGED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRANGED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRANGED UNPREDICTABLE.

VST3 (single 3-element structure from one lane)
For a description of this instruction and the encoding, see VST3 (single 3-element structure from one lane) on page F8-3366.

CONSTRANGED UNPREDICTABLE behavior
For all encodings:

• If \( d_3 > 31 \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register become unknown. This behavior does not affect any other memory locations.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRANGED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRANGED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRANGED UNPREDICTABLE.

VST4 (multiple 4-element structures)
For a description of this instruction and the encoding, see VST4 (multiple 4-element structures) on page F8-3368.

CONSTRANGED UNPREDICTABLE behavior
For all encodings:

• If \( d_4 > 31 \), then one of the following behaviors can occur:
  — The instruction is UNDEFINED.
  — The instruction executes as a NOP.
  — The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register become unknown. This behavior does not affect any other memory locations.
If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

**VST4 (single 4-element structure from one lane)**

For a description of this instruction and the encoding, see `VST4 (single 4-element structure from one lane)` on page F8-3370.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If `d4 > 31`, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register become unknown. This behavior does not affect any other memory locations.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

**VSTM**

For a description of this instruction and the encoding, see `VSTM on page F8-3372`.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If `regs == 0`, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction operates as a VSTM or VPUSH with the same addressing mode but loads no registers.

- If the register list includes a register that is out of range, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register become unknown. This behavior does not affect any other memory locations.

**Note**

Out of range means that the register list includes:

- A register with a number greater than the number of registers implemented.
- More than 16 double word registers.
- A double word register greater than D16 with an odd value of `imm8`.
If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

VPUSH

For a description of this instruction and the encoding, see VPUSH on page F8-3270.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If `regs == 0`, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction operates as a VSTM or VPUSH with the same addressing mode but loads no registers.

- If the register list includes a register that is out of range, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The memory locations specified by the instruction and the number of registers specified by the instruction if the register list had not gone out of range, become UNKNOWN. If the instruction specifies writeback, then that register become unknown. This behavior does not affect any other memory locations.

**Note**

Out of range means that the register list includes:

- A register with a number greater than the number of registers implemented.
- More than 16 double word registers.
- A double word register greater than D16 with an odd value of `imm8`.

If this instruction is not UNDEFINED, then whether it is affected by traps or enables relating to the use of the SIMD&FP registers when it is CONSTRAINED UNPREDICTABLE is IMPLEMENTATION DEFINED. The implementation must ensure that the CONSTRAINED UNPREDICTABLE behavior does not corrupt registers that are not accessible at the current Exception level by instructions that are not CONSTRAINED UNPREDICTABLE.

VTBL, VTBX

For a description of this instruction and the encoding, see VTBL, VTBX on page F8-3386.

**CONSTRAINED UNPREDICTABLE behavior**

For all encodings:

- If `n + length > 32`, then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - One or more of the SIMD&FP registers become UNKNOWN. This behavior does not affect any general-purpose registers.

A.1.3 **CONSTRAINED UNPREDICTABLE behavior, A32 and T32 system instructions**

This section lists the CONSTRAINED UNPREDICTABLE behavior for the different A32 and T32 system instructions listed in *Alphabetical list of system instructions* on page F7-3033 in alphabetical order. Unless specifically stated otherwise, the CONSTRAINED UNPREDICTABLE behavior applies to all encodings that can result in CONSTRAINED UNPREDICTABLE behavior,
**CPS (A32)**

For a description of this instruction and the encoding, see *CPS (A32)* on page F7-3036.

**CONSTRAINED UNPREDICTABLE behavior**

If the instruction transfers an illegal mode encoding to the CPSR mode field, then this invokes the Illegal Exception Return mechanism by not changing the mode, and setting CPSR.IL.

### Note

- An illegal mode encoding is either an UNALLOCATED mode encoding or one that is not accessible at the current Exception level.
- CPS executed from User mode acts as a NOP.

For the A1 encoding:

- If `(imod == '00 && M == '0') || imod == '01', then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
- If `mode != '00000' && M == '0', then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction operates as if `M == '1'.
  - The instruction operates as if `mode == '0000'.
- If `(imenod<1> == '1' && A:I:F == '000'), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction behaves as if `imenod<1> == '0'.
  - The instruction behaves as if `A:I:F had an UNKNOWON nonzero value.
- If `(imenod<1> == '0' && A:I:F != 000) then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction behaves as if `imenod<1> == '1'.
  - The instruction behaves as if `A:I:F == 000.

**CPS (T32)**

For a description of this instruction and the encoding, see *CPS (T32)* on page F7-3034.

**CONSTRAINED UNPREDICTABLE behavior**

If the instruction transfers an illegal mode encoding to the CPSR mode field, then this invokes the Illegal Exception Return mechanism by not changing the mode, and setting CPSR.IL.

### Note

- An illegal mode encoding is either an UNALLOCATED mode encoding or one that is not accessible at the current Exception level.
- CPS executed from User mode acts as a NOP.

For the T1 encoding:

- If `A:I:F == '000', then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.

---

CPS (A32)

For a description of this instruction and the encoding, see *CPS (A32)* on page F7-3036.

**CONSTRAINED UNPREDICTABLE behavior**

If the instruction transfers an illegal mode encoding to the CPSR mode field, then this invokes the Illegal Exception Return mechanism by not changing the mode, and setting CPSR.IL.

### Note

- An illegal mode encoding is either an UNALLOCATED mode encoding or one that is not accessible at the current Exception level.
- CPS executed from User mode acts as a NOP.

For the A1 encoding:

- If `(imod == '00 && M == '0') || imod == '01', then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
- If `mode != '00000' && M == '0', then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction operates as if `M == '1'.
  - The instruction operates as if `mode == '0000'.
- If `(imenod<1> == '1' && A:I:F == '000'), then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction behaves as if `imenod<1> == '0'.
  - The instruction behaves as if `A:I:F had an UNKNOWON nonzero value.
- If `(imenod<1> == '0' && A:I:F != 000) then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
  - The instruction behaves as if `imenod<1> == '1'.
  - The instruction behaves as if `A:I:F == 000.

CPS (T32)

For a description of this instruction and the encoding, see *CPS (T32)* on page F7-3034.

**CONSTRAINED UNPREDICTABLE behavior**

If the instruction transfers an illegal mode encoding to the CPSR mode field, then this invokes the Illegal Exception Return mechanism by not changing the mode, and setting CPSR.IL.

### Note

- An illegal mode encoding is either an UNALLOCATED mode encoding or one that is not accessible at the current Exception level.
- CPS executed from User mode acts as a NOP.

For the T1 encoding:

- If `A:I:F == '000', then one of the following behaviors can occur:
  - The instruction is UNDEFINED.
  - The instruction executes as a NOP.
For the T2 encoding:

- If `imod == '01'`, then one of the following behaviors can occur:
  - The instruction is **UNDEFINED**.
  - The instruction executes as a NOP.

- If `mode != '00000' && M == '0'`, then one of the following behaviors can occur:
  - The instruction is **UNDEFINED**.
  - The instruction executes as a NOP.
  - The instruction operates as if `M == '1'`.
  - The instruction behaves as if `mode == '0000'`.

- If `(imod<1> == '1' && A:I:F == '000')`, then one of the following behaviors can occur:
  - The instruction is **UNDEFINED**.
  - The instruction executes as a NOP.
  - The instruction behaves as if `imod<1> == '0'`.
  - The instruction behaves as if `A:I:F` had an **UNKNOWN** nonzero value.

- If `(imod<1> == '0' && A:I:F != '000')` then one of the following behaviors can occur:
  - The instruction is **UNDEFINED**.
  - The instruction executes as a NOP.
  - The instruction behaves as if `imod<1> == '1'`.
  - The instruction behaves as if `A:I:F == '000'`.

**LDM (exception return)**

For a description of this instruction and the encoding, see *LDM (exception return)* on page F7-3042.

**CONSTRAINED UNPREDICTABLE behavior**

If this instruction is executed in User mode or in System mode, then one of the following behaviors can occur:

- The instruction is **UNDEFINED**.
- The instruction executes as a NOP.

If `wback && registers<n> == '1'`, then one of the following behaviors can occur:

- The instruction is **UNDEFINED**.
- The instruction executes as a NOP.
- The instruction performs all the loads using the specified addressing mode and the content of the register being written back is **UNKNOWN**. In addition, if an exception occurs during the execution of this instruction, the base address might be corrupted so that the instruction cannot be repeated.

If the instruction transfers an illegal mode encoding to the CPSR mode field, then this invokes the Illegal Exception Return mechanism.

---

**Note**

An illegal mode encoding is either an **UNALLOCATED** mode encoding or one that is not accessible at the current Exception level.

---

**LDM (User registers)**

For a description of this instruction and the encoding, see *LDM (User registers)* on page F7-3044.
**CONSTRAINED UNPREDICTABLE behavior**

If \( \text{BitCount(registers)} < 1 \), then one of the following behaviors can occur:

- The instruction is **UNDEFINED**.
- The instruction executes as a NOP.
- The instruction operates as an \( \text{LDM} \) with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

If this instruction is executed in User mode or in System mode, then one of the following behaviors can occur:

- The instruction is undefined.
- The instruction executes as a NOP.
- The instruction operates as an \( \text{LDM} \) with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

**MRS**

For a description of this instruction and the encoding, see *MRS on page F7-3046*.

**CONSTRAINED UNPREDICTABLE behavior**

If this instruction is executed in User mode or in System mode and is accessing the SPSR, then one of the following behaviors can occur:

- The instruction is **UNDEFINED**.
- The instruction executes as a NOP.

**MSR (immediate)**

For a description of this instruction and the encoding, see *MSR (immediate) on page F7-3052*.

**CONSTRAINED UNPREDICTABLE behavior**

If this instruction is executed in User mode or in System mode and is accessing the SPSR, then one of the following behaviors can occur:

- The instruction is **UNDEFINED**.
- The instruction executes as a NOP.

If \( \text{mask == '0000' \&\& R == '1'} \), then one of the following behaviors can occur:

- The instruction is **UNDEFINED**.
- The instruction executes as a NOP.

If the instruction transfers an illegal mode encoding to the CPSR mode field, then this invokes the Illegal Exception Return mechanism by not changing the mode, and setting CPSR.IL.

---

**Note**

An illegal mode encoding is either an UNALLOCATED mode encoding or one that is not accessible at the current Exception level.

---

**MSR (register)**

For a description of this instruction and the encoding, see *MSR (register) on page F7-3054*. 
**CONSTRANDED UNPREDICTABLE behavior**

If this instruction is executed in User mode or in System mode and is accessing the SPSR, then one of the following behaviors can occur:

- The instruction is **UNDEFINED**.
- The instruction executes as a **NOP**.

If `mask == \'0000\'`, then one of the following behaviors can occur:

- The instruction is **UNDEFINED**.
- The instruction executes as a **NOP**.

If the instruction transfers an illegal mode encoding to the CPSR mode field, then this invokes the Illegal Exception Return mechanism by not changing the mode, and setting CPSR.IE.

--- **Note** ---

An illegal mode encoding is either an **UNALLOCATED** mode encoding or one that is not accessible at the current Exception level.

--- **RFE** ---

For a description of this instruction and the encoding, see **RFE** on page F7-3056.

**CONSTRANDED UNPREDICTABLE behavior**

If this instruction is executed in User mode or in T32EE state, then one of the following behaviors can occur:

- The instruction is **UNDEFINED**.
- The instruction executes as a **NOP**.

If the instruction transfers an illegal mode encoding to the CPSR mode field, then this invokes the Illegal Exception Return mechanism.

--- **Note** ---

An illegal mode encoding is either an **UNALLOCATED** mode encoding or one that is not accessible at the current Exception level.

--- **SRS (T32)** ---

For a description of this instruction and the encoding, see **SRS (T32)** on page F7-3060.

**CONSTRANDED UNPREDICTABLE behavior**

If this instruction is executed in User mode or in System mode, or the instruction is executed in T32EE state, then one of the following behaviors can occur:

- The instruction is **UNDEFINED**.
- The instruction executes as a **NOP**.

If the instruction specifies an illegal mode field, then one of the following behaviors can occur:

- The instruction is **UNDEFINED**.
- The instruction executes as a **NOP**.
- R13 of the current mode is used.
- The store occurs to an **UNKNOWN** address, and if the instruction specifies writeback, any general-purpose register that can be accessed without privilege violation from the current Exception level become unknown.
SRS (A32)

For a description of this instruction and the encoding, see SRS (A32) on page F7-3062.

**CONSTRAINED UNPREDICTABLE behavior**

If this instruction is executed in User mode or in System mode, then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

If the instruction specifies an illegal mode field, then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- R13 of the current mode is used.
- The store occurs to an UNKNOWN address, and if the instruction specifies writeback, any general-purpose register that can be accessed without privilege violation from the current Exception level become unknown.

STM (User registers)

For a description of this instruction and the encoding, see STM (User registers) on page F7-3064.

**CONSTRAINED UNPREDICTABLE behavior**

If $\text{BitCount}(\text{registers}) < 1$, then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

If the instruction is executed from User mode or System mode, then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction operates as an STM with the same addressing mode but targeting an unspecified set of registers. These registers might include R15.

SUBS PC, LR and related instructions (T32)

For a description of this instruction and the encoding, see SUBS PC, LR and related instructions (T32) on page F7-3066.

**CONSTRAINED UNPREDICTABLE behavior**

If this instruction is executed in User mode or in System mode, or the instructions are executed in T32EE state, then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

If the instruction transfers an illegal mode encoding to the CPSR mode field, then this invokes the Illegal Exception Return mechanism.

---

**Note**

An illegal mode encoding is either an UNALLOCATED mode encoding or one that is not accessible at the current Exception level.
SUBS PC, LR and related instructions (A32)

For a description of this instruction and the encoding, see SUBS PC, LR and related instructions (A32) on page F7-3068.

**CONSTRAINED UNPREDICTABLE behavior**

If this instruction is executed in User mode or in System mode, then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.

If the instruction transfers an illegal mode encoding to the CPSR mode field, then this invokes the Illegal Exception Return mechanism.

--- **Note** ---

An illegal mode encoding is either an UNALLOCATED mode encoding or one that is not accessible at the current Exception level.

VMRS

For a description of this instruction and the encoding, see VMRS on page F7-3070.

**CONSTRAINED UNPREDICTABLE behavior**

If \( t = 15 \) && \( \text{reg} \neq \text{"0001"} \), then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction transfers an UNKNOWN value to the specified general-purpose register.

In addition, CheckVFPEnabled(FALSE) can be called by this instruction for the CONSTRAINED UNPREDICTABLE cases.

VMSR

For a description of this instruction and the encoding, see VMSR on page F7-3072.

**CONSTRAINED UNPREDICTABLE behavior**

If \( \text{reg} = \text{"001x"} \mid \mid \text{reg} \neq \text{"01xx"} \), then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction transfers the value in the general-purpose register to one of the allocated registers accessible using VMSR at the same Exception level.

In addition, CheckVFPEnabled(FALSE) can be called by this instruction for the CONSTRAINED UNPREDICTABLE cases.

A.1.4 **CONSTRAINED UNPREDICTABLE behavior in Debug state**

Behavior in Debug state on page H2-4341 of this manual describes the CONSTRAINED UNPREDICTABLE behaviors that are specifically associated with Debug state.

A.1.5 **Using R13**

In prior versions of the architecture, the use of R13 as a named register specifier was described as UNPREDICTABLE in the pseudocode. In the ARMv8-A architecture, the use of R13 as a named register specifier is not UNPREDICTABLE, and R13 can be used in the regular form. Bits[1:0] of R13 are not treated as RES0, but can hold any values programmed into them.
A.1.6 Using R15

All uses of R15 as a named register specifier for a source register that are described as CONSTRAINED UNPREDICTABLE in the pseudocode or in other places in this reference manual can do one of the following:

• Cause the instruction to be treated as an UNDEFINED instruction.
• Cause the instruction to execute as a NOP.
• Read the PC with the standard offset that applies for the current instruction set.
• Read the PC with the standard offset that applies for the current instruction set with alignment to a word boundary.
• Read 0.
• Read an UNKNOWN value.

All uses of R15 as a named register specifier for a destination register that are described as CONSTRAINED UNPREDICTABLE in the pseudocode or in other places in this reference manual can do one of the following:

• Cause the instruction to be treated as UNDEFINED.
• Cause the instruction to execute as a NOP.
• Ignore the write.
• Branch to an UNKNOWN location in either A32 or T32 state.

The choice between these behaviors might in some implementations vary from instruction to instruction, or between different instances of the same instruction.

Instructions that are CONSTRAINED UNPREDICTABLE when the base register is R15 and the instruction specifies a writeback of the base register, are treated as having R15 as both a source register and a destination register.

For instructions that have two destination registers, for example LDRD, MRRC, and many of the multiply instructions, if Rt, Rt2, RdLo, or RdHi is R15, then the other destination register of the pair is UNKNOWN if the CONSTRAINED UNPREDICTABLE behavior for the write to R15 is either to ignore the write or to branch to an UNKNOWN location.

For instructions that affect any or all of CPSR.NZCV, CPSR.Q, and CPSR.GE when the register specifier is not R15, if the instruction is CONSTRAINED UNPREDICTABLE when the register specifier is R15, then the flags that the instruction would affect become UNKNOWN.

In addition, for MRC instructions for CP14 and CP15 that use R15 as the destination register descriptor, and thereby target APSR.NZCV, where these are described as being CONSTRAINED UNPREDICTABLE, ASPR.NZCV becomes UNKNOWN.

A.1.7 SBZ or SBO fields in instructions

Many of the A32 and T32 instructions have (0) or (1) in the instruction decode to indicate should-be-zero, SBZ, or should-be-one, SBO. Except for the specific cases called out in CONSTRAINED UNPREDICTABLE behavior for A32 and T32 instructions on page AppxA-4702, if the instruction bit pattern of an instruction is executed with these fields not having the should-be values, one of the following can occur:

• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction operates as if the bit had the should-be value.

The exceptions to this rule are:

• LDM/LDMIA/LDMFD (T32) on page AppxA-4705.
• LDMDB/LDMEA on page AppxA-4707.
• LDR (literal) on page AppxA-4713.
• LDRB (literal) on page AppxA-4713.
• LDRH (literal) on page AppxA-4714.
Appendix A Architectural Constraints on UNPREDICTABLE behaviors

A.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

• LDRSB (literal) on page AppxA-4714.
• LDRSH (literal) on page AppxA-4715.
• LDRD (immediate) on page AppxA-4715.
• LDRD (register) on page AppxA-4716.
• LDRD (literal) on page AppxA-4717.
• POP (T32) on page AppxA-4720.
• POP (A32) on page AppxA-4721.
• PUSH on page AppxA-4721.
• SDIV on page AppxA-4724.
• UDIV on page AppxA-4724.
• STM (STMIA, STMEA) on page AppxA-4727.
• STMDB (STMFD) on page AppxA-4728.

A.1.8 CONSTRAINED UNPREDICTABLE behavior in an IT block

A number of instructions in the architecture are described as being CONSTRAINED UNPREDICTABLE either:
• Anywhere within an IT block.
• As an instruction in an IT block other than the last instruction within an IT block.

Unless otherwise stated in this manual, when these instructions are committed for execution, one of the following occurs:
• An UNDEFINED exception results.
• The instructions are executed as if they had passed their condition code.
• The instructions are treated as NOPs. This means that they behave as if they had failed the condition code.

The behavior might in some implementations vary from instruction to instruction, or between different instances of the same instruction.

Many instructions that are CONSTRAINED UNPREDICTABLE in an IT block are branch instructions or other non-sequential instructions that change the PC. Where these instructions are not treated as UNDEFINED within an IT block, the remaining iterations of the CPSR.ITSTATE state machine can:
• Clear CPSR.ITSTATE.
• Advance CPSR.ITSTATE for either a sequential or a nonsequential change of the PC in the same way as they would do for instructions that are not CONSTRAINED UNPREDICTABLE that cause a sequential change of the PC.

——— Note ————
This does not apply to an instruction that is the last instruction in an IT block.

The instructions addressed by the updated PC can be:
• Executed as if they had passed the condition code check for the remaining iterations of the CPSR.ITSTATE state machine.
• Executed as NOPs. That is, they behave as if they failed the condition code check for the remaining iterations of the CPSR.ITSTATE state machine.
• Executed as if they were unconditional, or, if the instructions are part of another IT block, in accordance with the behavior in Branching into an IT block on page AppxA-4762.

The behavior might in some implementations vary from instruction to instruction, or between different instances of the same instruction.

For exception returns or Debug state exits that cause CPSR.ITSTATE to be set to a reserved value in T32 state or that return to A32 state with a nonzero value in CPSR.ITSTATE, the ITSTATE bits are forced to 00000000.

The reserved values are:
Exception returns or Debug state exits that set CPSR.ITSTATE to a non-reserved value in T32 state can occur when the flow of execution returns to a point:

- Outside an IT block, but with ITSTATE set to a value other than 00000000.
- Inside an IT block, but with a different value of ITSTATE than if the IT block had been executed without an exception return or Debug state exit.

In this case the instructions at the target of the exception return or Debug state exit can:

- Execute as if they passed the condition code check for the remaining iterations of the ITSTATE state machine.
- Execute as NOPs. That is, they behave as if they failed the condition code check for the remaining iterations of the ITSTATE state machine.
- Execute as if they were unconditional, or as if the instruction were part of another IT block, in accordance with the behavior in *Branching into an IT block*.

The remaining iterations of the CPSR.ITSTATE state machine can behave as follows:

- The ITSTATE state machine advances as if it were in an IT block.
- The ITSTATE bits are ignored.
- The ITSTATE bits are forced to 00000000.

### A.1.9 Branching into an IT block

Branching into an IT block leads to CONSTRAINED UNPREDICTABLE behavior. Execution starts from the address determined by the branch, but each instruction in the IT block is:

- Executed as if it were not in an IT block. This means that it is executed unconditionally.
- Executed as if it had passed its condition code check within an IT block.
- Executed as a NOP. That is, it behaves as if it had failed its condition code checks.

### A.1.10 Syndrome register handling for CONSTRAINED UNPREDICTABLE instructions treated as UNDEFINED

When a CONSTRAINED UNPREDICTABLE instruction is treated as UNDEFINED, this generates an UNDEFINED instruction exception:

- If this exception is taken in AArch64, then ESR_ELx is UNKNOWN.
- If this exception is taken at EL2 in AArch32, then HSR is unknown.

Note

The value written in ESR or HSR must be consistent with a value that could be created as the result of an exception from the same Exception level that generated the exception, but was the result of a situation that is not CONSTRAINED UNPREDICTABLE at that Exception level. This is to avoid a possible privilege violation.

### A.1.11 Unallocated values in register fields of CP14 and CP 15 registers and translation table entries

Unless otherwise stated, all unallocated or reserved values of fields with allocated values within CP15 registers and translation table entries behave in one of the following ways:

- The encoding maps onto any of the allocated values, but otherwise does not cause CONSTRAINED UNPREDICTABLE behavior.
Appendix A Architectural Constraints on UNPREDICTABLE behaviors

A.1 AArch32 CONSTRAINED UNPREDICTABLE behaviors

A.1.12 Unallocated CP14 and CP15 instructions

In ARMv8-A, accesses to unallocated CP14 and CP15 register encodings are UNDEFINED.

A.1.13 Loads and Stores to unaligned locations

Some unaligned loads and stores in the ARMv7 architecture are described as UNPREDICTABLE. These are defined in the ARMv8-A architecture to do one of the following:

- Take an alignment fault.
- Perform the specified load or store to the unaligned memory location.

A.1.14 Branching to an unaligned PC

If branching to an address in A32 state which is not word aligned is defined to be UNPREDICTABLE, then one of the following behaviors can occur:

- The unaligned location is forced to be aligned.
- The unaligned address generates a Prefetch Abort exception on the first instruction using the unaligned PC value. If this is executed in EL0 when EL2 is using AArch32 and HCR.TGE == 1, or EL2 is using AArch64 and HCR_EL2.TGE == 1, then the exception is taken to EL2.

Where the exception is taken to EL1 or EL3 using AArch32:

- If TTBCR.EAE == 0, IFSR[10, 3:0] takes the value 00001.
- If TTBCR.EAE == 1, IFSR[5:0] takes the value 100001.

If the exception is taken to EL2 using AArch32, then:

- The HCR.EC code of 0x22 is used.
- HSR.IL is UNKNOWN
- HCR.ISS[24:0] is RES0.

The IFAR or HIFAR takes the value of the address that faulted, including the misaligned low order bit[1]. The R14_abt/ELR holds the address that faulted, including the misaligned low order bit[1] with the standard offset associated with that exception.

--- Note ---

Because bit[0] is used for interworking, it is impossible to specify a branch to A32 state when the bottom bit of the target address is 1. Therefore the bottom bit of IFAR or HIFAR is 0 for all these cases.

A.1.15 Unpredictable CPACR and NSACR settings

If CPACR.cp<n> contains the encoding 0b10, then one of the following behaviors can occur:

- The encoding maps onto any of the allocated values, but otherwise does not cause UNPREDICTABLE behavior.
- The encoding causes effects that could be achieved by a combination of more than one of the allocated encodings.

--- Note ---

In ARMv7, CPACR had a D32DIS bit, and NSACR had a NSD32DIS bit. There is no CPACR.D32DIS or NSACR.NSD32DIS in ARMv8-A, and the corresponding bits in the two registers are RES0.
A.1.16  **Instruction fetches from Device memory**

Instruction fetches from Device memory are UNPREDICTABLE.

If a location in memory with the Device attribute is not marked as execute-never, then an implementation might perform speculative instruction accesses to this memory location at times when the MMU is enabled.

If branches cause the program counter to point to an area of memory with the Device attribute that is not marked as execute-never for the current Exception level for instruction fetches, then an implementation can perform one of the following behaviors:

- It can treat the instruction fetch as if it were to a memory location with the Normal, Non-cacheable attribute.
- It can take a permission fault.

A.1.17  **Multi-access instructions that load the PC from Device memory**

Multi-access instructions that load the PC from Device memory when the MMU is enabled are unpredictable in AArch32 state. In the ARMv8-A architecture in AArch32, an implementation can perform one of the following behaviors:

- It can load the PC from the memory location as if the memory location had the Normal Non-cacheable attribute.
- It can take a permission fault.

A.1.18  **Out of range virtual address**

If the PE executes an instruction for which the instruction address, size, and alignment mean it contains the bytes 0xFFFFFFFF and 0x00000000, then the bytes that wrap around and appear to be from 0x00000000 onwards come from an UNKNOWN address.

If the PE executes a load or store instruction for which the computed address, total access size, and alignment mean it accesses bytes 0xFFFFFFFF and 0x00000000, then the bytes that wrap around and appear to be from 0x00000000 onwards come from an UNKNOWN address.

A.1.19  **Translation Table Base Address alignment**

An misaligned Translation Table Base Address can occur if:

- The VMSAv8-32 Short-descriptor translation table format is enabled and TTBR0[13-N:7], which is defined to be RES0, contains one or more nonzero values.
- The VMSAv8-32 Long-descriptor translation table format is enabled, and TTBR0[x-1:3], TTBR1[x-1:3], HTTBR[x-1:3], or VTTBR[x-1:3], which are defined to be RES0, contain one or more nonzero values.

If a misaligned Translation Table Base Address occurs, then one of the following behaviors can occur:

- The field that is defined to be RES0 is treated as if all bits were zero:
  - The value that is read back might be the value written or it might be zero.
- The calculation of an address for a translation table walk using that register can be corrupted in those bits that are nonzero.
A.2 Constraints on AArch64 state UNPREDICTABLE behaviors

It contains the following sections:

- Overview of the constraints on AArch64 UNPREDICTABLE behaviors.
- CONSTRAINED UNPREDICTABLE behavior for A64 instructions.

A.2.1 Overview of the constraints on AArch64 UNPREDICTABLE behaviors

The term UNPREDICTABLE describes a number of cases where the architecture has a feature that software must not use. For execution in AArch64 state, the ARMv8-A architecture specifies a narrow range of permitted behaviors. This range is the range of CONSTRAINED UNPREDICTABLE behavior. All implementations that are compliant with the architecture must follow the CONSTRAINED UNPREDICTABLE behavior.

Note
Software designed to be compatible with the ARMv8-A architecture must not rely on these CONSTRAINED UNPREDICTABLE cases being handled in any way other than those listed under the heading CONSTRAINED UNPREDICTABLE.

A.2.2 CONSTRAINED UNPREDICTABLE behavior for A64 instructions

This section lists the CONSTRAINED UNPREDICTABLE behavior for the different A64 instructions listed in Chapter C5 A64 Base Instruction Descriptions and Chapter C6 A64 SIMD and Floating-point Instruction Descriptions.

LDR (immediate)

For a description of this instruction and the encoding, see LDR (immediate) on page C5-517.

CONSTRAINED UNPREDICTABLE behavior

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and \( n = t \land n \neq 31 \), then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

Note
Pre-indexed and post-indexed addressing implies writeback.

LDRB (immediate)

For a description of this instruction and the encoding, see LDRB (immediate) on page C5-524.

CONSTRAINED UNPREDICTABLE behavior

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and \( n = t \land n \neq 31 \), then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.
Note
Pre-indexed and post-indexed addressing implies writeback.

LDRH (immediate)

For a description of this instruction and the encoding, see LDRH (immediate) on page C5-530.

CONstrained UNPREDICTABLE behavior

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and n == t && n != 31, then one of the following behaviors can occur:
• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs the load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

Note
Pre-indexed and post-indexed addressing implies writeback.

LDRSB (immediate)

For a description of this instruction and the encoding, see LDRSB (immediate) on page C5-536.

CONstrained UNPREDICTABLE behavior

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and n == t && n != 31, then one of the following behaviors can occur:
• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs the load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

Note
Pre-indexed and post-indexed addressing implies writeback.

LDRSH (immediate)

For a description of this instruction and the encoding, see LDRSH (immediate) on page C5-542.

CONstrained UNPREDICTABLE behavior

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and n == t && n != 31, then one of the following behaviors can occur:
• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs the load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

Note
Pre-indexed and post-indexed addressing implies writeback.
LDRSW (immediate)

For a description of this instruction and the encoding, see LDRSW (immediate) on page C5-548.

**CONSTRAINED UNPREDICTABLE behavior**

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and $n = t \&\& n \neq 31$, then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs the load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

Note

Pre-indexed and post-indexed addressing implies writeback.

LDP

For a description of this instruction and the encoding, see LDP on page C5-511.

**CONSTRAINED UNPREDICTABLE behavior**

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and $(t == n || t2 == n) \&\& n \neq 31$, then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs a load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

If $t == t2$, then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs all of the loads using the specified addressing mode, and the register loaded is set to an UNKNOWN value.

Note

Pre-indexed and post-indexed addressing implies writeback.

LDPSW

For a description of this instruction and the encoding, see LDPSW on page C5-514.

**CONSTRAINED UNPREDICTABLE behavior**

If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and $(t == n || t2 == n) \&\& n \neq 31$, then one of the following behaviors can occur:

- The instruction is UNDEFINED.
- The instruction executes as a NOP.
- The instruction performs a load using the specified addressing mode, and the base register is set to an UNKNOWN value. In addition, if an exception occurs during such an instruction, the base register might be corrupted so that the instruction cannot be repeated.

If $t == t2$, then one of the following behaviors can occur:

- The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs all of the loads using the specified addressing mode, and the register loaded is set to an UNKNOWN value.

Note
Pre-indexed and post-indexed addressing implies writeback.

LDNP (SIMD&FP)
For a description of this instruction and the encoding, see LDNP (SIMD&FP) on page C6-1052.

CONSTRAINED UNPREDICTABLE behavior
If \( t = t_2 \), then one of the following behaviors can occur:
• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs a load using the specified addressing mode, and the base register is set to an UNKNOWN value.

LDP (SIMD&FP)
For a description of this instruction and the encoding, see LDP (SIMD&FP) on page C6-1054.

CONSTRAINED UNPREDICTABLE behavior
If \( t = t_2 \), then one of the following behaviors can occur:
• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs a load using the specified addressing mode, and the base register is set to an UNKNOWN value.

LDAXP
For a description of this instruction and the encoding, see LDAXP on page C5-497.

CONSTRAINED UNPREDICTABLE behavior
If \( t = t_2 \), then one of the following behaviors can occur:
• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs a load using the specified addressing mode, and the base register is set to an UNKNOWN value.

LDXP
For a description of this instruction and the encoding, see LDXP on page C5-579.
Appendix A Architectural Constraints on UNPREDICTABLE behaviors
A.2 Constraints on AArch64 state UNPREDICTABLE behaviors

STR (immediate)
For a description of this instruction and the encoding, see STR (immediate) on page C5-694.

CONSTRAINED UNPREDICTABLE behavior
If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and n == t && n != 31, then one of the following behaviors can occur:
• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs a store using the specified addressing mode but the value stored is UNKNOWN.

Note
Pre-indexed and post-indexed addressing implies writeback.

STRB (immediate)
For a description of this instruction and the encoding, see STRB (immediate) on page C5-700.

CONSTRAINED UNPREDICTABLE behavior
If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and n == t && n != 31, then one of the following behaviors can occur:
• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs a store using the specified addressing mode but the value stored is UNKNOWN.

Note
Pre-indexed and post-indexed addressing implies writeback.

STRH (immediate)
For a description of this instruction and the encoding, see STRH (immediate) on page C5-706.

CONSTRAINED UNPREDICTABLE behavior
If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and n == t && n != 31, then one of the following behaviors can occur:
• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs a store using the specified addressing mode but the value stored is UNKNOWN.

Note
Pre-indexed and post-indexed addressing implies writeback.

STP
For a description of this instruction and the encoding, see STP on page C5-691.

CONSTRAINED UNPREDICTABLE behavior
If the instruction encoding specifies pre-indexed addressing or post-indexed addressing, and (t == n || t2 == n) && n != 31, then one of the following behaviors can occur:
• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs a store using the specified addressing mode but the value stored is UNKNOWN.

Note
Pre-indexed and post-indexed addressing implies writeback.

STLXR
For a description of this instruction and the encoding, see STLXR on page C5-680.

CONSTRAINED UNPREDICTABLE behavior
If \( s = t \) \( || \) (pair \&\& \( s = t2 \)), then one of the following behaviors can occur:
• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs the store to the specified address, but the value stored is UNKNOWN.

If \( s = n \) \&\& \( n \neq 31 \) then one of the following behaviors can occur:
• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs the store to an UNKNOWN address.

STLXRB
For a description of this instruction and the encoding, see STLXRB on page C5-683.

CONSTRAINED UNPREDICTABLE behavior
If \( s = t \) \( || \) (pair \&\& \( s = t2 \)), then one of the following behaviors can occur:
• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs the store to the specified address, but the value stored is UNKNOWN.

If \( s = n \) \&\& \( n \neq 31 \) then one of the following behaviors can occur:
• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs the store to an UNKNOWN address.

STLXRH
For a description of this instruction and the encoding, see STLXRH on page C5-686.

CONSTRAINED UNPREDICTABLE behavior
If \( s = t \) \( || \) (pair \&\& \( s = t2 \)), then one of the following behaviors can occur:
• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs the store to the specified address, but the value stored is UNKNOWN.

If \( s = n \) \&\& \( n \neq 31 \) then one of the following behaviors can occur:
• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs the store to an UNKNOWN address.

STXR
For a description of this instruction and the encoding, see STXR on page C5-727.
**CONSTRAINED UNPREDICTABLE behavior**

If \( s = t \) or \( (\text{pair} \& \& s = t_2) \), then one of the following behaviors can occur:

- The instruction is **UNDEFINED**.
- The instruction executes as a NOP.
- The instruction performs the store to the specified address, but the value stored in **UNKNOWN**.

If \( s = n \) and \( n \neq 31 \) then one of the following behaviors can occur:

- The instruction is **UNDEFINED**.
- The instruction executes as a NOP.
- The instruction performs the store to an **UNKNOWN** address.

**STXRB**

For a description of this instruction and the encoding, see **STXRB on page C5-730**.

**CONSTRAINED UNPREDICTABLE behavior**

If \( s = t \) or \( (\text{pair} \& \& s = t_2) \), then one of the following behaviors can occur:

- The instruction is **UNDEFINED**.
- The instruction executes as a NOP.
- The instruction performs the store to the specified address, but the value stored in **UNKNOWN**.

If \( s = n \) and \( n \neq 31 \) then one of the following behaviors can occur:

- The instruction is **UNDEFINED**.
- The instruction executes as a NOP.
- The instruction performs the store to an **UNKNOWN** address.

**STXRH**

For a description of this instruction and the encoding, see **STXRH on page C5-733**.

**CONSTRAINED UNPREDICTABLE behavior**

If \( s = t \) or \( (\text{pair} \& \& s = t_2) \), then one of the following behaviors can occur:

- The instruction is **UNDEFINED**.
- The instruction executes as a NOP.
- The instruction performs the store to the specified address, but the value stored in **UNKNOWN**.

If \( s = n \) and \( n \neq 31 \) then one of the following behaviors can occur:

- The instruction is **UNDEFINED**.
- The instruction executes as a NOP.
- The instruction performs the store to an **UNKNOWN** address.

**STLXP**

For a description of this instruction and the encoding, see **STLXP on page C5-677**.

**CONSTRAINED UNPREDICTABLE behavior**

If \( s = t \) or \( (\text{pair} \& \& s = t_2) \), then one of the following behaviors can occur:

- The instruction is **UNDEFINED**.
- The instruction executes as a NOP.
- The instruction performs the store to the specified address, but the value stored in **UNKNOWN**.

If \( s = n \) and \( n \neq 31 \) then one of the following behaviors can occur:

- The instruction is **UNDEFINED**.
- The instruction executes as a NOP.
• The instruction performs the store to an UNDEFINED address.

**STXP**

For a description of this instruction and the encoding, see STXP on page C5-724.

**CONSTRAINED UNPREDICTABLE behavior**

If $s == t \lor (\text{pair} \land s == t2)$, then one of the following behaviors can occur:

• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs the store to the specified address, but the value stored in UNDEFINED.

If $s == n \land n \neq 31$ then one of the following behaviors can occur:

• The instruction is UNDEFINED.
• The instruction executes as a NOP.
• The instruction performs the store to an UNDEFINED address.
Appendix B
Recommended External Debug Interface

This appendix describes the recommended external debug interface. It contains the following sections:

- About the recommended external debug interface on page AppxB-4774.
- PMUEVENT bus on page AppxB-4777.
- DBGCPUDONE on page AppxB-4778.
- Recommended authentication interface on page AppxB-4779.
- Management registers and CoreSight compliance on page AppxB-4782.

Note

This recommended external debug interface specification is not part of the ARM architecture specification. Implementers and users of the ARMv8 architecture must not consider this appendix as a requirement of the architecture. It is included as an appendix to this manual only:

- As reference material for users of ARM products that implement this interface.
- As an example of how an external debug interface might be implemented.

The inclusion of this appendix is no indication of whether any ARM products might, or might not, implement this external debug interface. For details of the implemented external debug interface you must always see the appropriate product documentation.
B.1 About the recommended external debug interface

See the Note on the first page of this appendix for information about the architectural status of this recommended debug interface.

This specification provides a recommended external debug interface for ARMv8 to define a standard set of connections for validation environments. The connection between components, such as between the PE and Trace extension or between the PE and the CTI, is not described here. Table B-1 shows the signals in the recommended interface.

</tr>
</tbody>
</table>

\(^a\) The value of $n$ depends on the size of the address space occupied by the Debug port.

For details see AMBA APB3. ARM recommends a single slave port for all integrated debug components.

PADDRDBG31 distinguishes memory-mapped and DAP accesses:

- $0$: Memory-mapped access
- $1$: DAP access

Figure B-1 on page AppxB-4776 shows the recommended debug interface.
In Figure B-1, signals with a lower-case n suffix are active LOW and all other signals are active HIGH.
B.2 PMUEVENT bus

The PMUEVENT bus exports Performance Monitor events from the PE to an on-chip agent. ARM recommends that it has the following characteristics:

- The bus is synchronous.
- The width of the bus is IMPLEMENTATION DEFINED.
- It is IMPLEMENTATION DEFINED which events are exported on the bus.
- Each exported event occupies a contiguous sub-field of the bus. ARM recommends that the sub-fields of the bus are occupied in the same order as the event numbers.
- If the event can only occur once per cycle, it occupies a single bit. If the event can occur more than once per cycle, it is IMPLEMENTATION DEFINED how the event is encoded. The encoding depends on constraints such as the designated use of the event bus and the number of pins available. For example, the event can be encoded:
  - As a count, using a plain binary number. This is the most useful encoding when exporting to an external counter. It is not a useful encoding for exporting to a Trace extension external input.
  - As a count, using thermometer encoding. This is the most useful encoding when exporting to a Trace extension.
  - Using a single bit encoding to indicate whether the event count is zero or non-zero. This is useful for exporting to an activity monitor where the number of pins is constrained.

If a Trace extension is implemented, the PMUEVENT bus is normally connected to the Trace extension using the external inputs. TRCXTINSELR multiplexes a wide PMUEVENT bus to a narrow set of inputs. An external PMUEVENT bus might also be provided. For more information, contact ARM.
B.3 DBGCPUDONE

The PE asserts DBGCPUDONE only after it has completed all Non-debug state memory accesses. Therefore, the system can use DBGCPUDONE as an indicator that all memory accesses issued by the PE result from operations performed by a debugger.
B.4 Recommended authentication interface

The details of the debug authentication interface are IMPLEMENTATION DEFINED.

ARM recommends the use of the CoreSight interface, which has four signals for external debug authentication:

- **DBGEN**
- **SPIDEN**
- **NIDEN**
- **SPNIDEN**

CoreSight forbids asserting **SPIDEN** without also asserting **DBGEN**. CoreSight also forbids asserting **SPNIDEN** without also asserting **NIDEN**.

ARM recommends an interface in which **DBGEN** and **SPIDEN** are also used for self-hosted secure debug authentication if either:

- EL3 is using AArch32 and SDCR.SPD == 0b00.
- Secure EL1 is using AArch32 and MDCR_EL3.SPD32 == 0b00.

If EL3 is not implemented and the PE is in Non-secure state, **SPIDEN** and **SPNIDEN** are not implemented, and the PE behaves as if these signals were tied LOW.

If EL3 is not implemented and the PE is in Secure state, **SPIDEN** is usually connected to **DBGEN** and **SPNIDEN** is connected to **NIDEN**, but this is not required. The recommended interface is defined as if all four signals are implemented.

How the authentication signals are driven is IMPLEMENTATION DEFINED. For example, the signals might be hard-wired, connected to fuses, or to an authentication module. The architecture permits PEs within a cluster to have independent authentication interfaces, but this is not required. ARM recommends that any Trace extension has the same authentication interface as the PE it is connected to.

Table B-2 shows the debug authentication pseudocode functions and the recommended implementations.

<table>

<td>(DBGEN AND SPIDEN)</td>
</tr>
<tr>
<td>See Pseudocode details for AArch32 Self-Hosted Secure Privileged Invasive Debug Enabled on page AppxB-4780</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

| ExternalSecureNoninvasiveDebugEnabled() | Secure non-invasive debug enabled | (DBGEN OR NIDEN) AND (SPIDEN OR SPNIDEN) |
| See Pseudocode details for External Invasive Debug Enabled on page AppxB-4780 | | |

| ExternalSecureInvasiveDebugEnabled() | Secure invasive debug enabled | (DBGEN AND SPIDEN) |
| See Pseudocode details for External Secure Invasive Debug Enabled on page AppxB-4780 | | |

| ExternalNoninvasiveDebugEnabled() | Non-secure non-invasive debug enabled | (DBGEN OR NIDEN) |
| See Pseudocode details for External Non-invasive Debug Enabled on page AppxB-4781 | | |

| ExternalInvasiveDebugEnabled() | Non-secure invasive debug enabled | DBGEN |
| See Pseudocode details for External Secure Non-invasive Debug Enabled on page AppxB-4781 | | |

The following assertions must apply to all implementations:

if !ExternalInvasiveDebugEnabled() then assert !ExternalSecureInvasiveDebugEnabled()

if !ExternalNoninvasiveDebugEnabled() then assert !ExternalSecureNoninvasiveDebugEnabled()
if ExternalInvasiveDebugEnabled() then assert ExternalNoninvasiveDebugEnabled()
if ExternalSecureInvasiveDebugEnabled() then assert ExternalSecureNoninvasiveDebugEnabled()

The definition for the Debug_authentication() function is as follows:

```cpp
signal DBGEN;

signal NIDEN;

signal SPIDEN;

signal SPNIDEN;
```

### B.4.1 Pseudocode details for AArch32 Self-Hosted Secure Privileged Invasive Debug Enabled

The pseudocode for the AArch32SelfHostedSecurePrivilegedInvasiveDebugEnabled() function is as follows:

```cpp
// AArch32SelfHostedSecurePrivilegedInvasiveDebugEnabled()
// =======================================================
boolean AArch32SelfHostedSecurePrivilegedInvasiveDebugEnabled()
// In the recommended interface, AArch32SelfHostedSecurePrivilegedInvasiveDebugEnabled returns
// the state of the (DBGEN AND SPIDEN) signal.
if !HaveEL(EL3) && !IsSecure() then return FALSE;
return DBGEN == HIGH && SPIDEN == HIGH;
```

### B.4.2 Pseudocode details for External Invasive Debug Enabled

The pseudocode for the ExternalInvasiveDebugEnabled() function is as follows:

```cpp
// ExternalInvasiveDebugEnabled()
// ==============================
boolean ExternalInvasiveDebugEnabled()
// In the recommended interface, ExternalInvasiveDebugEnabled returns the state of the DBGEN
// signal.
return DBGEN == HIGH;
```

### B.4.3 Pseudocode details for External Secure Invasive Debug Enabled

The pseudocode for the ExternalSecureInvasiveDebugEnabled() function is as follows:

```cpp
// ExternalSecureInvasiveDebugEnabled()
// ====================================
boolean ExternalSecureInvasiveDebugEnabled()
```
In the recommended interface, ExternalSecureInvasiveDebugEnabled returns the state of the
(DBGEN AND SPIDEN) signal.
CoreSight allows asserting SPIDEN without also asserting DBGEN, but this is not recommended.
if !HaveEL(EL3) && !IsSecure() then return FALSE;
return ExternalInvasiveDebugEnabled() && SPIDEN == HIGH;

B.4.4 Pseudocode details for External Non-invasive Debug Enabled

The pseudocode for the ExternalNoninvasiveDebugEnabled() function is as follows:

boolean ExternalNoninvasiveDebugEnabled()
// In the recommended interface, ExternalNoninvasiveDebugEnabled returns the state of the
// (DBGEN OR NIDEN) signal.
return ExternalInvasiveDebugEnabled() || NIDEN == HIGH;

B.4.5 Pseudocode details for External Secure Non-invasive Debug Enabled

The pseudocode for the ExternalSecureNoninvasiveDebugEnabled() function is as follows:

boolean ExternalSecureNoninvasiveDebugEnabled()
// In the recommended interface, ExternalSecureNoninvasiveDebugEnabled returns the state of the
// (DBGEN OR NIDEN) AND (SPIDEN OR SPNIDEN) signal.
if !HaveEL(EL3) && !IsSecure() then return FALSE;
return ExternalNoninvasiveDebugEnabled() && (SPIDEN == HIGH || SPNIDEN == HIGH);
B.5 Management registers and CoreSight compliance

The CoreSight architecture requires the implementation of a set of management registers that occupy the memory map from 0xF00 upwards in each of the debug components.

CoreSight compliance and complete implementation of the management registers is OPTIONAL, but ARM recommends that the registers are implemented.

The CoreSight architecture specification recommends that any integration test registers are implemented starting from 0xEFC downwards. Each of the debug components has an IMPLEMENTATION DEFINED region from 0xE80 to 0xEFC for this purpose.

B.5.1 CoreSight interface register map

Table B-3 shows the external management register maps for the following registers:

ED These are the external debug register.
CTI These are the Cross-trigger interface registers.
PMU These are the Performance Monitors registers.

B.5 Management registers and CoreSight compliance

B.5.2 Management register access permissions

Access to the OPTIONAL Integration Control register (ITCTRL) is IMPLEMENTATION DEFINED.

If the Debug power domain is off, all register accesses return an error.

Otherwise, Table B-4 on page AppxB-4784, Table B-5 on page AppxB-4785, and Table B-6 on page AppxB-4786 show the response to accesses by the external debug interface to the CoreSight management registers. For definitions of the terms used in the tables, see External debug interface register access permissions summary on page H8-4453.

Note
Access to the CoreSight management registers is not affected by the values of EDAD and EPMAD.

Table B-3 CoreSight interface register map (continued)

</tr>
<tr>
<td>0xFFC</td>
<td>EDCIDR3</td>
<td>CTICIDR3 PMCIDR3</td>
</tr>
</tbody>
</table>

a. This register must always be implemented, regardless of whether the component is CoreSight compliant.
b. If implemented, the number of CLAIM bits is IMPLEMENTATION DEFINED and can be discovered by reading CLAIMSET.
c. If the CTI implements CTIv1, this register is not implemented. See the register description for details.
d. The Software lock registers are defined as part of CoreSight compliance, but their contents depend on the type of access that is made and whether the OPTIONAL Software lock is implemented. See the register description for details.

The terms in Table B-4 on page AppxB-4784, Table B-5 on page AppxB-4785, and Table B-6 on page AppxB-4786 are defined as follows:

Domain
This describes the power domain in which the register is logically implemented. Registers described as implemented in the Core power domain might be implemented in the Debug power domain, as long as they exhibit the required behavior.

Conditions
This lists the conditions under which the access is attempted. To determine the access permissions for a register, read these columns from left to right, and stop at first column which lists the condition as being true.

The conditions are:

Off EDPRSR.PU == 0. The Core power domain is completely off, or in low-power state. In these cases the Core power domain registers cannot be accessed.

Note
If debug power is off, then all external debug interface accesses return an error.

**DLK**  
DoubleLockStatus() == TRUE. The OS Double Lock is locked, that is, EDPRSR.DLK == 1.

**OSLK**  
OSLSR.OSLK == 1. The OS Lock is locked.

**Default**  
This provides the default access permissions, if there are no conditions that prevent access to the register.

**SLK**  
This provides the modified default access permissions for OPTIONAL memory-mapped accesses to the external debug interface if the OPTIONAL Software Lock is locked. See Register access permissions for memory-mapped accesses on page H8-4449. For all other accesses, this column is ignored.

The access permissions are:

- This means that the default access permission applies. See the Default column, or the SLK column, if applicable.

**RO**  
This means that the register or field is read-only.

**RW**  
This means that the register or field is read/write. Individual fields within the register might be RO. See the relevant register description for details.

**RC**  
This means that the bit clears to 0 after a read.

**(SE)**  
This means that accesses to this register have indirect write side-effects. A side-effect occurs when a direct read or a direct write of a register creates an indirect write to the same register or to another register.

**WO**  
This means that the register or field is write-only.

**WI**  
This means that the register or field ignores writes.

**IMP DEF**  
This means that the access permissions are IMPLEMENTATION DEFINED.

### B.5.3 Management register resets

Table B-7 shows the management register resets. This table does not include:

- Read-only identification registers that have a fixed value from reset. These registers include those with the DEVAFFn, DEVARCH, DEVID[n], DEVTYPE, PIDRn, and CIDRn mnemonics.

- Registers that have the AUTHSTATUS mnemonic. This is a read-only status register that reflects the status outside of the reset domain of the register.

- Registers that have the LAR mnemonic. These are write-only registers that only have an effect on writes.

All other fields in the management registers are reset to an IMPLEMENTATION DEFINED value which can be UNKNOWN. The registers are in the reset domain specified in the table.

Table B-7 shows a summary of the management register resets.

Appendix C
Recommendations for Performance Monitors Event Numbers for IMPLEMENTATION DEFINED Events

This appendix describes the ARM recommendations for the use of the IMPLEMENTATION DEFINED event numbers. It contains the following section:

- ARM recommendations for IMPLEMENTATION DEFINED event numbers on page AppxC-4790.
- Summary of events taken to an Exception Level using AArch64 on page AppxC-4801.
C.1 ARM recommendations for IMPLEMENTATION DEFINED event numbers

These are the ARM recommendations for the use of the IMPLEMENTATION DEFINED event numbers. ARM does not define these events as rigorously as those in the architectural and microarchitectural event lists, and an implementation might:

- Modify the definition of an event to better correspond to the implementation.
- Not use some, or many, of these event numbers.
- Include cumulative occupancy for resource queues such as data access queues, and entry/exit counts, so that average latencies can be determined and counts for key resources that might exist can be separated.
- Provide registers in the IMPLEMENTATION DEFINED space to further extend such counts by, for example, specifying a minimum latency for an event to be counted.
- Use cumulative occupancy for resource queues, such as data access queues, and entry/exit counts, so that average latencies can be determined, separating out counts for key resources that might exist:
  — An implementation might also provide registers in the IMPLEMENTATION DEFINED space to further extend such counts, by, for example, specifying a minimum latency for an event to be counted.

Table C-1 lists the PMU IMPLEMENTATION DEFINED event numbers in event number order.

**0x40, Level 1 data cache access, read**

This event is similar to Level 1 data cache access but the counter counts only memory-read operations that access at least the Level 1 data or unified cache.

**0x41, Level 1 data cache access, write**

This event is similar to Level 1 data cache access but the counter counts only memory-write operations that access at least the Level 1 data or unified cache.

The counter counts DC ZVA as a store instruction.

**0x42, Level 1 data cache refill, read**

This event is similar to Level 1 data cache refill but the counter counts only memory-read operations that cause a refill of at least the Level 1 data or unified cache.

**0x43, Level 1 data cache refill, write**

This event is similar to Level 1 data cache refill but the counter counts only memory-write operations that cause a refill of at least the Level 1 data or unified cache.

The counter counts DC ZVA as a store instruction.
Appendix C Recommendations for Performance Monitors Event Numbers for IMPLEMENTATION DEFINED Events
C.1 ARM recommendations for IMPLEMENTATION DEFINED event numbers

0x44, Level 1 data cache refill, inner
This event is similar to Level 1 data cache refill but the counter counts only memory-read and memory-write operations that generate refills satisfied by transfer from another cache inside of the immediate cluster.

--- Note ---
The boundary between inner and outer is IMPLEMENTATION DEFINED, and it is not necessarily linked to other similar boundaries, such as the boundary between Inner Cacheable and Outer Cacheable or the boundary between Inner Shareable and Outer Shareable.

0x45, Level 1 data cache refill, outer
This event is similar to Level 1 data cache refill but the counter counts only memory-read and memory-write operations that generate refills satisfied from outside of the immediate cluster.

0x46, Level 1 data cache write-back, victim
This event is similar to Level 1 data cache write-back but the counter counts only write-backs that are a result of the line being allocated for an access made by the PE.
CP15 cache maintenance operations do not count as events.
It is IMPLEMENTATION DEFINED whether a write of a whole cache line that is not the result of the eviction of a line from the cache is counted. For example, this might occur if the PE detects streaming writes to memory and does not allocate lines to the cache, or as the result of a DC ZVA.

0x47, Level 1 data cache write-back, cleaning and coherency
This event is similar to Level 1 data cache write-back but the counter counts only write-backs that are a result of a coherency operation made by another PE or from a CP15 cache maintenance operation. Whether write-backs made as a result of CP15 cache maintenance operations are counted is IMPLEMENTATION DEFINED.
If a coherency request from a requestor outside the PE results in a write-back, it is an Unattributable event.

--- Note ---
The transfer of a dirty cache line from the Level 1 data cache of this PE to the Level 1 data cache of another PE due to a hardware coherency operation is not counted unless the dirty cache line is also written back to a Level 2 cache or memory.

0x48, Level 1 data cache invalidate
The counter counts each invalidation of a cache line in the Level 1 data or unified cache.
The counter does not count events:
• If a cache refill invalidates a line.
• For locally executed CP15 cache set/way maintenance operations.
If a coherency request from a requestor outside the PE results in a write-back, it is an Unattributable event.

0x4C, Level 1 data TLB refill, read
This event is similar to Level 1 data TLB refill but the counter counts only memory-read operations that cause a data TLB refill of a least the Level 1 data or unified TLB.

0x4D, Level 1 data TLB refill, write
This event is similar to Level 1 data TLB refill but the counter counts only memory-write operations that cause a data TLB refill of a least the Level 1 data or unified TLB.
The counter counts DC ZVA as a store instruction.
Appendix C Recommendations for Performance Monitors Event Numbers for IMPLEMENTATION DEFINED Events

C.1 ARM recommendations for IMPLEMENTATION DEFINED event numbers

0x50, Level 2 data cache access, read
This event is similar to Level 2 data cache access but the counter counts only memory-read operations that access at least the Level 2 data or unified cache.

0x51, Level 2 data cache access, write
This event is similar to Level 2 data cache access but the counter counts only memory-write operations that access at least the Level 2 data or unified cache.
The counter counts DC ZVA as a store instruction.

0x52, Level 2 data cache refill, read
This event is similar to Level 2 data cache refill but the counter counts only memory-read operations that cause a refill of at least the Level 2 data or unified cache.

0x53, Level 2 data cache refill, write
This event is similar to Level 2 data cache refill but the counter counts only memory-write operations that cause a refill of at least the Level 2 data or unified cache.
The counter counts DC ZVA as a store instruction.

0x56, Level 2 data cache write-back, victim
This event is similar to Level 2 data cache write-back but the counter counts only write-backs that are a result of the line being allocated for an access made by the PE.

CP15 cache maintenance operations do not count as events.

It is IMPLEMENTATION DEFINED whether a write of a whole cache line that is not the result of the eviction of a line from the cache is counted. For example, this might occur if the PE detects streaming writes to memory and does not allocate lines to the cache, or as the result of a DC ZVA.

0x57, Level 2 data cache write-back, cleaning and coherency
This event is similar to Level 2 data cache write-back but the counter counts only write-backs that are a result of a coherency operation made by another PE or CP15 cache maintenance operation.

Whether write-backs made as a result of CP15 cache maintenance operations are counted is IMPLEMENTATION DEFINED.

Note
The transfer of a dirty cache line from the Level 2 data cache of this PE to the Level 2 data cache of another PE due to a hardware coherency operation is not counted unless the dirty cache line is also written back to a Level 3 cache or memory.

If a coherency request from a requestor outside the PE results in a write-back, it is an Unattributable event.

0x58, Level 2 data cache invalidate
The counter counts each invalidation of a cache line in the Level 2 data or unified cache.

The counter does not count events:
• If a cache refill invalidates a line.
• For locally executed CP15 set/way cache maintenance operations.

Note
Software that uses this event must know whether the Level 2 data cache is shared with other PEs. This event does not follow the general rule of Level 2 data cache events of only counting events that directly affect this PE.

If a coherency request from a requestor outside the PE results in a write-back, it is an Unattributable event.
0x60, **Bus access, read**
This event is similar to bus access but the counter counts only memory-read operations that access outside the boundary of the PE and its closely-coupled caches.

0x61, **Bus access, write**
This event is similar to bus access but the counter counts only memory-write operations that access outside the boundary of the PE and its closely-coupled caches.

0x62, **Bus access, Normal, Cacheable, Shareable**
This event is similar to bus access but the counter counts only memory-read and memory-write operations that make Normal, Cacheable, Shareable accesses outside the boundary of the PE and its closely-coupled caches.

--- **Note** ---
It is IMPLEMENTATION DEFINED how the PE translates the attributes from the translation table entry for a region to the attributes on the bus.

In particular, a region of memory designated as Normal, Cacheable, Inner Shareable, Not Outer Shareable by a translation table entry, might be marked as either Shareable or Not Shareable at the boundary of the PE and its closely-coupled caches. This depends on where the IMPLEMENTATION DEFINED boundary lies, between Inner and Outer Shareable.

If the Inner Shareable extends beyond the PE boundary, and the bus indicates the distinction between Inner and Outer Shareable, then either is counted as Shareable for the purposes of defining this event.

0x63, **Bus access, not Normal, Cacheable, Shareable**
This event is similar to bus access but the counter counts only memory-read and memory-write operations that make accesses outside the boundary of the PE and its closely-coupled caches that are not Normal, Cacheable, Shareable. For example, the counter counts accesses marked as:

- Normal, Cacheable, Not Shareable.
- Normal, Not Cacheable.
- Device.

--- **Note** ---
It is IMPLEMENTATION DEFINED, how the PE translates the attributes from the translation table entries for a region to the attributes on the bus.

In particular, a region of memory designated as Normal, Cacheable, Inner Shareable, Not Outer Shareable by a translation table entry, might be marked as either Shareable or Not Shareable at the boundary of the PE and its closely-coupled caches. This depends on where the IMPLEMENTATION DEFINED boundary lies, between Inner and Outer Shareable.

If the Inner Shareable extends beyond the PE boundary, and the bus indicates the distinction between Inner and Outer Shareable, then either is counted as Shareable for the purposes of defining this event.

0x64, **Bus access, normal**
This event is similar to bus access but the counter counts only memory-read and memory-write operations that make Normal accesses outside the boundary of the PE and its closely-coupled caches. For example, the counter counts Normal, Cacheable and Normal, Not Cacheable accesses but does not count Device accesses.

0x65, **Bus access, peripheral**
This event is similar to bus access but the counter counts only memory-read and memory-write operations that make Device accesses outside the boundary of the PE and its closely-coupled caches.
0x66, Data memory access, read
This event is similar to data memory access but the counter counts only memory-read operations that the PE made.

0x67, Data memory access, write
This event is similar to data memory access but the counter counts only memory-write operations made by the PE.

0x68, Unaligned access, read
This event is similar to data memory access but the counter counts only unaligned memory-read operations that the PE made. It also counts unaligned accesses if they are subsequently transposed into multiple aligned accesses.

0x69, Unaligned access, write
This event is similar to data memory access but the counter counts only unaligned memory-write operations that the PE made. It also counts unaligned accesses if they are subsequently transposed into multiple aligned accesses.

0x6A, Unaligned access
This event is similar to data memory access but the counter counts only unaligned memory-read operations and unaligned memory-write operations that the PE made. It also counts unaligned accesses if they are subsequently transposed into multiple aligned accesses.

0x6C, Exclusive operation speculatively executed, Load-Exclusive
The counter counts Load-Exclusive instructions speculatively executed. The definition of speculatively executed is IMPLEMENTATION DEFINED.

0x6D, Exclusive operation speculatively executed, Store-Exclusive pass
The counter counts Store-Exclusive instructions speculatively executed that completed a write. The definition of speculatively executed is IMPLEMENTATION DEFINED but must be the same as for the exclusive operation speculatively executed, Load-Exclusive event.

0x6E, Exclusive operation speculatively executed, Store-Exclusive fail
The counter counts Store-Exclusive instructions speculatively executed that fail to complete a write. It is within the IMPLEMENTATION DEFINED definition of speculatively executed whether this includes conditional instructions that fail the condition code check. The definition of speculatively executed is IMPLEMENTATION DEFINED but must be the same as for the exclusive operation speculatively executed, Load-Exclusive event.

0x6F, Exclusive operation speculatively executed, Store-Exclusive
The counter counts Store-Exclusive instructions speculatively executed. The definition of speculatively executed is IMPLEMENTATION DEFINED but it must be the same as for the exclusive operation speculatively executed, Load-Exclusive event. ARM recommends that this event is implemented if it is not possible to implement the exclusive operation speculatively executed, Store-Exclusive fail, events with the same degree of speculation as the exclusive operation speculatively executed, Load-Exclusive event.

0x70, Operation speculatively executed, load
This event is similar to the operation speculatively executed but the counter counts only memory-reading instructions. Defined by the instruction architecturally executed, condition code check pass, load event, see Common event numbers on page D6-1839. The definition of speculatively executed is IMPLEMENTATION DEFINED but must be the same as for the operation speculatively executed event.
0x71, Operation speculatively executed, store

This event is similar to the operation speculatively executed but the counter counts only memory-writing instructions. Defined by the instruction architecturally executed, condition code check pass, store event, see Common event numbers on page D6-1839.

The counter counts DC ZVA as a store operation.

The definition of speculatively executed is IMPLEMENTATION DEFINED but must be the same as for the operation speculatively executed event.

0x72, Operation speculatively executed, load or store

This event is similar to the operation speculatively executed but the counter counts only memory-reading instructions and memory-writing instructions. Defined by the instruction architecturally executed, condition code check pass, load and instruction architecturally executed, condition code check pass, store events, see Common event numbers on page D6-1839.

The definition of speculatively executed is IMPLEMENTATION DEFINED but must be the same as for the operation speculatively executed event.

0x73, Operation speculatively executed, integer data-processing

This event is similar to the operation speculatively executed but counts only integer data-processing instructions. It counts the following operations that operate on the general-purpose registers:

- In AArch64 state, Data processing - immediate on page C2-140 and Data processing - register on page C2-145.
- In AArch32 state, Data-processing instructions on page F1-2383.

This includes 90V and 90N operations.

This event also counts the following miscellaneous instructions:

- In AArch64 state, System register instructions on page C2-126, System instructions on page C2-126, and Hint instructions on page C2-127.
- In AArch32 state, Status register access instructions on page F1-2391, Banked register access instructions on page F1-2391, Miscellaneous instructions on page F1-2395, other than ISB and preloads, and Coprocessor instructions on page F1-2397, other than coprocessor load and store instructions.

If the preload instructions PRFM, PLD, PLDW, and PLI do not count as memory-reading instructions then they must count as integer data-processing instructions.

If ISBs do not count as software change of the PC then they must count as integer data-processing instructions.

The definition of speculatively executed is IMPLEMENTATION DEFINED, but must be the same as for the operation speculatively executed event.

It is IMPLEMENTATION DEFINED whether the following instructions are counted as integer data-processing operations, SIMD operations, or floating-point operations, but ARM recommends that the instructions are all counted as integer data-processing operations:

- For AArch64 state, from the A64 floating-point convert to integer class, operations that move a value between a general-purpose register and a SIMD and floating-point register without type conversion:
  - FMOV (general).

- For AArch64 state, from the SIMD Move group, operations that move a values between a general-purpose register and an element or elements in a SIMD and floating-point register:
  - DUP (general).
  - SMOV.
  - UMov.
  - INS (general).
• In AArch32 state:
  — VDUP (general-purpose register) and all VMOV instructions that transfer data between a
    general-purpose register and a SIMD and floating-point register.
  — VMRS.
  — VMSR.

0x74, Operation speculatively executed, Advanced SIMD

This event is similar to the operation speculatively executed but the counter counts only Advanced
SIMD data-processing instructions, see:
• For AArch64 state, the SIMD operations listed in Data processing - SIMD and floating-point
  on page C2-152
• For AArch32 state, Advanced SIMD data-processing instructions on page F1-2401

This includes all operations that operate on the SIMD and floating-point registers, except those that
are counted as:
• Integer data-processing operations.
• Floating-point data-processing operations.
• Memory-reading operations.
• Memory-writing operations.
• Cryptographic operations other than PMULL, in AArch64 state.
• VVULL, in AArch32 state.

Advanced SIMD scalar operations are counted as Advanced SIMD operations, including those
which operate on floating-point values. In AArch64 state, PMULL, and in AArch32 state, VVULL are
counted as Advanced SIMD operations.

The definition of speculatively executed is IMPLEMENTATION DEFINED, but must be the same as for
the operation speculatively executed event.

0x75, Operation speculatively executed, floating-point

This event is similar to the operation speculatively executed but the counter counts only
floating-point data-processing instructions, see:
• In AArch64 state, the floating-point operations listed in Data processing - SIMD and floating-point
  on page C2-152.
• In AArch32 state, Floating-point data-processing instructions on page F1-2408.

This includes all operations that operate on the SIMD and floating-point registers as floating-point
values, except for SIMD scalar operations and those that are counted as one of:
• Integer data-processing.
• Memory-reading operations.
• Memory-writing operations.

The following instructions that take both an integer register and a floating-point register argument
and perform a type conversion (to/from integer or to/from fixed-point), are counted as floating-point
data-processing operations:
• In AArch64 state, FCVT{<mode>}, UCVTF, and SCVTF.
• In AArch32, VCVT<mode>(floating-point), VCVT, VCVT, and VCVT.

The definition of speculatively executed is IMPLEMENTATION DEFINED, but must be the same as for
the operation speculatively executed event.

0x76, Operation speculatively executed, software change of the PC

This event is similar to the operation speculatively executed but the counter counts only software
changes of the PC. Defined by the instruction architecturally executed, condition code check pass,
software change of the PC event, see Common event numbers on page D6-1839.

The definition of speculatively executed is IMPLEMENTATION DEFINED but must be the same as for
the operation speculatively executed event.
Appendix C Recommendations for Performance Monitors Event Numbers for IMPLEMENTATION DEFINED Events

C.1 ARM recommendations for IMPLEMENTATION DEFINED event numbers

See also PC_WRITE_RETIRED in Table D6-6 on page D6-1839.

0x77, **Operation speculatively executed, Cryptographic instruction**

This event is similar to the operation speculatively executed but the counter counts only Cryptographic instructions, except PMULL and VMULL, see Cryptography extensions on page C2-169.

The definition of speculatively executed is IMPLEMENTATION DEFINED but must be the same as for the operation speculatively executed event.

0x78, **Branch speculatively executed, immediate branch**

The counter counts immediate branch instructions speculatively executed. Defined by the instruction architecturally executed, immediate branch event, see Common event numbers on page D6-1839.

The definition of speculatively executed is IMPLEMENTATION DEFINED.

See also BR_IMMED_RETIRED in Table D6-6 on page D6-1839.

0x79, **Branch speculatively executed, procedure return**

The counter counts procedure return instructions speculatively executed. Defined by the instruction architecturally executed, condition code check pass, procedure return event, see Common event numbers on page D6-1839.

The definition of speculatively executed is IMPLEMENTATION DEFINED.

See also BR_RETURN_RETIRED in Table D6-6 on page D6-1839.

0x7A, **Branch speculatively executed, indirect branch**

The counter counts indirect branch instructions speculatively executed. This includes software change of the PC other than exception-generating instructions and immediate branch instructions.

The definition of speculatively executed is IMPLEMENTATION DEFINED.

0x7C, **Barrier speculatively executed, ISB**

The counter counts instruction synchronization barrier instructions speculatively executed, including CP15ISB.

The definition of speculatively executed is IMPLEMENTATION DEFINED.

0x7D, **Barrier speculatively executed, DSB**

The counter counts data synchronization barrier instructions speculatively executed, including CP15DSB.

The definition of speculatively executed is IMPLEMENTATION DEFINED.

0x7E, **Barrier speculatively executed, DMB**

The counter counts data memory barrier instructions speculatively executed, including CP15DSB. It does not include the implied barrier operations of load/store operations with release consistency semantics.

The definition of speculatively executed is IMPLEMENTATION DEFINED.

0x81, **Exception taken, other synchronous**

This event is similar to exception taken but the counter counts only synchronous exceptions that are not counted by the other Exception taken events. This event counts only exceptions taken locally.

0x82, **Exception taken, Supervisor Call**

This event is similar to exception taken but the counter counts only Supervisor Call exceptions. This event counts only exceptions taken locally.

0x83, **Exception taken, Instruction Abort**

This event is similar to exception taken but the counter counts only Instruction Abort exceptions. This event counts only exceptions taken locally.
0x84, Exception taken, Data Abort or SError
   This event is similar to exception taken but the counter counts only Data Abort or SError interrupt exceptions. The counter counts only exceptions taken locally.

0x86, Exception taken, IRQ
   This event is similar to exception taken but the counter counts only IRQ exceptions. The counter counts only exceptions taken locally, including Virtual IRQ exceptions.

0x87, Exception taken, FIQ
   This event is similar to exception taken but the counter counts only FIQ exceptions. The counter counts only exceptions taken locally, including Virtual FIQ exceptions.

0x88, Exception taken, Secure Monitor Call
   This event is similar to exception taken but the counter counts only Secure Monitor Call exceptions. The counter does not increment on SMC instructions trapped as a Hyp Trap exception.

0x8A, Exception taken, Hypervisor Call
   This event is similar to exception taken but the counter counts only Hypervisor Call exceptions. The counter counts for both Hypervisor Call exceptions taken locally in the hypervisor and those taken as an exception from Non-secure EL1.

0x8B, Exception taken, Instruction Abort not taken locally
   This event is similar to exception taken but the counter counts only Instruction Abort exceptions not taken locally.

0x8C, Exception taken, Data Abort or SError not taken locally
   This event is similar to exception taken but the counter counts only Data Abort or SError interrupt exceptions not taken locally.

0x8D, Exception taken, other traps not taken locally
   This event is similar to exception taken but the counter counts only those traps that are not counted as:
   • Exception taken, Hypervisor Call.
   • Exception taken, Instruction Abort not taken locally.
   • Exception taken, Data Abort or SError not taken locally.
   • Exception taken, IRQ not taken locally.
   • Exception taken, FIQ not taken locally.

0x8E, Exception taken, IRQ not taken locally
   This event is similar to exception taken but the counter counts only IRQ exceptions not taken locally.

0x8F, Exception taken, FIQ not taken locally
   This event is similar to exception taken but the counter counts only FIQ exceptions not taken locally.

0x90, Release consistency operation speculatively executed, Load-Acquire
   The counter counts Load-Acquire operations that are speculatively executed. The definition of speculatively executed is IMPLEMENTATION DEFINED.

0x91, Release consistency operation speculatively executed, Store-Release
   The counter counts Store-Release operations that are speculatively executed. The definition of speculatively executed is IMPLEMENTATION DEFINED.
### C.2 Summary of events taken to an Exception Level using AArch64

Table C-2 shows the events for exceptions taken to an Exception level using AArch64.

</tbody>
</table>

**Note**

In these definitions, an exception that is *taken locally* means an exception that is taken to the default Exception level, and is not routed to another Exception level. See *Exception levels on page D1-1408* for more information.
Appendix D

Example OS Save and Restore sequences

This appendix provides possible OS Save and Restore sequences for a v8 Debug implementation. It contains the following sections:

• *Save Debug registers* on page AppxD-4804.
• *Restore Debug registers* on page AppxD-4806.
D.1 Save Debug registers

This section shows how to save the registers that are used by an external debugger.

; On entry, X0 points to a block to save the debug registers in.
; Returns the pointer beyond the block and corrupts X1-X3

SaveDebugRegisters

; (1) Set OS lock.
MOV     X2,#1                       ; Set the OS lock. In AArch64 state, the OS lock
MSR     OSLAR_EL1,X2                ; is writable via OSLAR.
ISB                                 ; Context synchronization operation

; (2) Walk through the registers, saving them
MRS     X1,OSDTRRX_EL1              ; Read DTRRX
MRS     X2,OSDTRTX_EL1              ; Read DTRTX
STP     W1,W2,[X0],#8               ; Save { DTRRX, DTRTX }
MRS     X1,MDSCR_EL1                ; Read DSCR
MRS     X2,OSECCR_EL1               ; Read ECCR
STP     W1,W2,[X0],#8               ; Save { DSCR, ECCR }

[ AARCH32_SUPPORTED
MRS     X1,DBGVCR32_EL2             ; Read DBGVCR
MRS     X2,DBGCLAIMCLR_EL1          ; Read CLAIM - note, have to read via CLAIMCLR
STP     W1,W2,[X0],#8               ; Save { VCR, CLAIM }
]

;; Macros for saving off a “register pair”
;; $WB is W for watchpoint, B for breakpoint
;; $num is the pair’s number
;; X0 contains a pointer for the value words
;; X1 contains a pointer for the control words
;; W2 contains the max index

MACRO
  SaveRP  $WB,$num, $exit
    MRS     X3,DBG$WB.VR$num._EL1       ; Read DBGxVRn
    STR     X3,[X0],#8                  ; Save { xVRn }
    MRS     X3,DBG$WB.CR$num._EL1       ; Read DBGxCRn
    STR     W3,[X0],#4                  ; Save { xCRn }
  [ $num > 1 :LAND: $num < 15

}
Appendix D Example OS Save and Restore sequences
D.1 Save Debug registers

```
CMP     W1,#$num
BEQ     $exit

MEND

; (3) Breakpoints
MRS     X1,ID_AA64DFR0_EL1
UBFX    W1,W1,#12,#4                ; Extract BRPs field
MACRO
SaveBRP $num                        ; Save a Breakpoint Register Pair
    SaveRP  B,$num,SaveDebugRegisters_Watchpoints
NEND
    SaveBRP 0
    SaveBRP 1
    SaveBRP 2
    ;; and so on to ...
    SaveBRP 15

SaveDebugRegisters_Watchpoints

; (4) Watchpoints
MRS     X1,ID_AA64DFR0_EL1          ; Read DBGDIDR
UBFX    W1,W1,#20,#4                ; Extract WRPs field
MACRO
SaveWRP $num                        ; Save a Watchpoint Register Pair
    SaveRP  W,$num,SaveDebugRegisters_Exit
NEND
    SaveWRP 0
    SaveWRP 1
    SaveWRP 2
    ;; and so on to ...
    SaveWRP 15

SaveDebugRegisters_Exit

; (5) Return the pointer to first word not read. This pointer is already in X0, so
; all that is needed is to return from this function. The OS double-lock (OSDLR_EL1.DLK) is
; locked later, just before the final entry to WFI state.
RET
```
### D.2 Restore Debug registers

This section shows how to restore the registers that are used by an external debugger.

; On entry, X0 points to a block of saved debug registers.
; Returns the pointer beyond the block and corrupts R1-R3,R12.

**RestoreDebugRegisters**

; (1) Lock OS lock. The lock will already be set, but this write is included to ensure it
; is locked.
MOV     X2,#1                       ; Lock the OS lock. In AArch64 state, the OS lock
MSR     OSLAR_EL1,X2                ; is writable via OSLAR.
ISB                         ; Context synchronization operation

; (2) Walk through the registers, restoring them
LDP     W1,W2,[X0],#8               ; Read { DTRRX,DTRTX }
MSR     OSDTRRX_EL1,X1              ; Restore DTRRX
MSR     OSDTRTX_EL1,X2              ; Restore DTRTX
LDP     W1,W2,[X0],#8               ; Read { DSCR, ECCR }
MSR     MDSCR_EL1,X1                ; Restore DSCR
MSR     OSECCR_EL1,X2               ; Restore ECCR

[ AARCH32_SUPPORTED
LDP     W1,W2,[X0],#8               ; Read { VCR,CLAIM }
MSR     DBGVCR32_EL2,X1             ; Restore DBGVCR
MSR     DBGCLAIMSET_EL1,X2          ; Restore CLAIM – note, writes CLAIMSET
]

;; Macro for restoring a "register pair"
MACRO
RestoreRP $WB,$num,$exit
LDR     X3,[X0],#8                  ; Read { xVRn }
MSR     DBG$WB.VR$num._EL1,X3       ; Restore DBGxVRn
LDR     W3,[X0],#4                  ; Read { xCRn }
MSR     DBG$WB.CR$num._EL1,X3       ; Restore DBGxCRn
[ $num >= 1 :LAND: $num < 15

RestoreWRP 15

RestoreDebugRegisters_Exit
; (5) Clear the OS lock.
ISB
MOV X2, #0                      ; Clear the OS lock. In AArch64 state, the OS lock
MSR OSLAR_EL1, X2              ; is writable via OSLAR.

; (6) A final ISB guarantees the restored register values are visible to subsequent
; instructions.
ISB
; (7) Return the pointer to first word not read. This pointer is already in X0, so
; all that is needed is to return from this function.

RET
Appendix E
Additional Guidance

This chapter provides information about implementing and using the ARM architecture. It contains the following sections:

- Implementation guidance for multiple views of Debug registers on page AppxE-4810.
- AArch32 equivalent Advanced SIMD Mnemonics on page AppxE-4813.
- Identifying the cache resources in ARMv8 on page AppxE-4821.
- Memory access mode in Debug state on page AppxE-4822.

--- Note ---

This description is not part of the ARM architecture specification. It is included here as supplementary information, for the convenience of developers and users who might find this information useful.
**E.1 Implementation guidance for multiple views of Debug registers**

Table E-1 and Table E-2 on page AppxE-4811 show the aliases and list the access permissions for each of the bits in the Debug System Control Registers.

For definitions of each system register bit see MDSCR_EL1[18:15, 13:12, 5:2, 0], and EDSCR[30:29, 27:26, 23:21, 14, 6]. All other bits are reserved, RES0.

Table E-1 shows the implementation requirements for Debug system control registers in AArch64 state, but software must not rely on reserved fields being RAZ or RAZ/WI.

a. Software must not rely on this bit ignoring writes when OSLK == 0, and must treat the value read as UNKNOWN.
b. This field does not map to a system register view. See `EDSCR, External Debug Status and Control Register` on page H9-4531.
c. Software must treat this value as an UNKNOWN value on save. It must be preserved on restore.

a. ARM deprecates the use of this field.
b. This field does not map to a system register view. See EDSCR, External Debug Status and Control Register on page H9-4531.
c. Software must treat this value as an UNKNOWN value on save. It must be preserved on restore.
d. UNKNOWN at EL0.
e. Software must not rely on this bit ignoring writes when OSLK == 0, and must treat the value read as UNKNOWN.
f. UNKNOWN at EL0. ARM deprecates the use of this field.
g. See RES0 for details of how RES0 applies to this bit.
### E.2 AArch32 equivalent Advanced SIMD Mnemonics

Table E-3 shows a comparison of the AArch32 instructions and their AArch64 counterparts. It also lists instructions that are new to AArch64.

**Note**

All Advanced SIMD floating-point functionality changes implicitly to comply with the FPCR rounding mode field, the Default NaN control, the Flush-to-Zero control, and, where supported by the implementation, the Exception trap enable bits.

E.3 Identifying the cache resources in ARMv8

In ARMv8 the architecture defines support for multiple levels of cache, up to a maximum of seven levels. This complicates the process of identifying the cache resources available to a PE on an ARMv8 implementation. To obtain this information, software must:

1. Read the Cache Type Register to find the indexing and tagging policy used for the Level 1 instruction cache. This register also provides the size of the smallest cache lines used for the instruction caches, and for the data and unified caches. These values are used in cache maintenance operations.

2. Read the Cache Level ID Register to find what caches are implemented. The register includes seven Cache type fields, for cache levels 1 to 7. Scanning these fields, starting from Level 1, identifies the instruction, data or unified caches implemented at each level. This scan ends when it reaches a level at which no caches are defined. The Cache Level ID Register also provides the Level of Unification and the Level of Coherency for the cache implementation.

3. For each cache identified at stage 2:
   • Write to the Cache Size Selection Register to select the required cache. A cache is identified by its level, and whether it is:
     — An instruction cache.
     — A data or unified cache.
   • Read the Cache Size ID Register to find details of the cache.
E.4 Memory access mode in Debug state

The following subsections provide information about memory access modes in Debug state:

- Alignment constraints.
- Using memory access mode in AArch64 state.

This information is an addition to the information provided in Chapter H4 The Debug Communication Channel and Instruction Transfer Register.

E.4.1 Alignment constraints

If the address in X0 or R0 is not aligned to a multiple of four, the behavior is as follows:

- For each external DTR access a CONSTRAINED UNPREDICTABLE choice of:
  1. The PE makes an unaligned memory access to X0 or R0. If alignment checking is enabled for the memory access, this generates an Alignment fault.
  2. The PE makes a memory access to Align(X[0],4) in AArch64 state, or Align(R[0],4) in AArch32 state.
  3. The PE generates an Alignment fault, regardless of whether alignment checking is enabled.
  4. The PE does nothing.

- Following each memory access, if there is no Data Abort, X0 or R0 is updated with an UNKNOWN value.
- For external writes to DBGDTRRX_EL0, if the PE writes to memory, an UNKNOWN value is written.
- For external reads of DBGDTRTX_EL0 an UNKNOWN value is returned.
- The RXfull and TXfull flags are left in an UNKNOWN state, meaning that a DBGDTRTX_EL0 read can trigger a TX underrun, and a DBGDTRRX_EL0 write can trigger an RX overrun.

The ARM preferred implementation is:

- The PE makes an unaligned memory access to X0 or R0. If alignment checking is enabled for the memory access, this generates an Alignment fault.
- Following each memory access, if there is no Data Abort, X0 is updated with X0 + 4 or R0 is updated with R0 + 4.
- For external writes to DBGDTRRX_EL0, if the PE writes to memory, the word written to DBGDTRRX_EL0 is written.
- For external reads of DBGDTRTX_EL0, the result of the unaligned load is returned.
- The RXfull and TXfull flags are updated as normal.

E.4.2 Using memory access mode in AArch64 state

Figure E-1 on page AppxE-4823 and Figure E-2 on page AppxE-4824 show the processes for using memory access mode to implement a download (external host to target) and an upload (target to external host).

To transfer \(n\) words of data:

- The download sequence needs \(n+6\) accesses by the external debug interface.
- The upload sequence needs \(n+8\) accesses by the external debug interface.

In both cases, in the innermost loop the debugger can make an external access to a DTR without polling EDSCR after each write as underrun and overrun detection prevent failure. Normally external accesses from the debugger are outpaced by the memory accesses of the PE, making underruns and overruns unlikely. If this is not the case, the EDSCR.ERR flag is set to 1. This is checked once at the end of the sequence, although a debugger can check it more often, for example once for each page. If the EDSCR.ERR flag is set to 1 because of overrun or underrun, the debugger can restart. The address to restart from is frozen in X0. EDSCR.ERR might also be set because of a Data abort.

If underruns and overruns are common, the debugger can pace itself accordingly.
Note

- The base address must be a multiple of 4.
- The order of the writes that set up the address does not matter in Debug state.

In Figure E-1, the sequence for the fast code download is as follows:

1. **Setup.** From the external debug interface:
   a. Write address [31:0] to DBGDTRRX_EL0.
   b. Write address [63:32] to DBGDTRTX_EL0.
   c. Write $\text{MRS X0,DBGDTR_EL0}$ to EDITR. The PE executes this instruction.
   d. Set EDSCR.MA to 1.

2. **Loop** $n$ times. From the external debug interface:
   a. Write to DBGDTRRX_EL0. The PE reads the word from DTRRX and stores it to memory. It increments X0 by 4.

3. **Epilogue.** From the external debug interface:
   a. Clear EDSCR.MA to 0.
   b. Read EDSCR to check for overruns or Data Aborts during download.

---

**Figure E-1 Fast code download in AArch64 (external host to target)**
In Figure E-2, the sequence for the fast code download is as follows:

1. Setup. From the external debug interface:
   a. Write address [31:0] to DBGDTRRX_EL0.
   b. Write address [63:32] to DBGDTRTX_EL0.
   c. Write `MRS X0, DBGDTR_EL0` to EDITR.
   d. Write `MSR DBGDTR_EL0, X0` to EDITR. This dummy operation ensures EDSCR.TXfull == 1.
   e. Set EDSCR.MA to 1.
   f. Read DBGDTRTX_EL0 and discard the value. The PE returns the previous DTR value, loads the first word, and writes it to DTR. It increments X0 by 4.

2. Loop \( n-1 \) times. From the external debug interface:
   a. Read DBGDTRRX_EL0. The PE returns the previous DTRRX value, loads a new word, and writes it to DTRTX. It increments X0 by 4.

3. Epilogue. From the external debug interface:
   a. Clear EDSCR.MA to 0.
   b. Read DBGDTRTX_EL0 for the \( n \)th value.

Figure E-2 Fast data upload in AArch64 (target to external host)
c. Read EDSCR to check for underruns, overruns or Data Aborts during upload.

E.4 Memory access mode in Debug state
Appendix F
Barrier Litmus Tests

This appendix gives examples of the use of the barrier instructions provided by the ARMv8 architecture. It contains the following sections:

• Introduction on page AppxF-4828.
• Load-Acquire, Store-Release and barriers on page AppxF-4831.
• Load-Acquire Exclusive, Store-Release Exclusive and barriers on page AppxF-4839.
• Using a mailbox to send an interrupt on page AppxF-4845.
• Cache and TLB maintenance operations and barriers on page AppxF-4846.
• ARMv7 compatible approaches for ordering, using DMB and DSB barriers on page AppxF-4859.

Note

This information is not part of the ARM architecture specification. It is included here as supplementary information, for the convenience of developers and users who might require this information.
Appendix F Barrier Litmus Tests

F.1 Introduction

The exact rules for the insertion of barriers into code sequences is a very complicated subject, and this appendix describes many of the corner cases and behaviors that are possible in an implementation of the ARMv8 architecture.

This appendix is to help programmers, hardware design engineers, and validation engineers understand the need for the different kinds of barriers.

F.1.1 Overview of memory consistency

Early generations of microprocessors were relatively simple processing engines that executed each instruction in program order. In such processors, the effective behavior was that each instruction was executed in its entirety before a subsequent instruction started to be executed. This behavior is sometimes referred to as the *Sequential Execution Model* (SEM).

In later processor generations, the needs to increase processor performance, both in terms of the frequency of operation and the number of instructions executed each cycle, mean that such a simple form of execution is abandoned. Many techniques, such as pipelining, write buffering, caching, speculation, and out-of-order execution, are introduced to provide improved performance.

For general purpose PEs, such as ARM, these microarchitectural innovations are largely hidden from the programmer by a number of microarchitectural techniques. These techniques ensure that, within an individual PE, the behavior of the PE largely remains the same as the SEM. There are some exceptions to this where explicit synchronization is required. In the ARM architecture, these are limited to cases such as:

- Synchronization of changes to the instruction stream.
- Synchronization of changes to system control registers.

In both these cases, the ISB instruction provides the necessary synchronization.

While the effect of ordering is largely hidden from the programmer within a single PE, the microarchitectural innovations have a profound impact on the ordering of memory accesses. Write buffering, speculation, and cache coherency protocols, in particular, can all mean that the order in which memory accesses occur, as seen by an external observer, differs significantly from the order of accesses that would appear in the SEM. This is usually invisible in a uniprocessor environment, but the effect becomes much more significant when multiple PEs are trying to communicate in memory. In reality, these effects are often only significant at particular synchronization boundaries between the different threads of execution.

The problems that arise from memory ordering considerations are sometimes described as the problem of memory consistency. Processor architectures have adopted one or more memory consistency models, or memory models, that describe the permitted limits of the memory re-ordering that can be performed by an implementation of the architecture. The comparison and categorization of these has generated significant research and comment in academic circles, and ARM recommends the *Memory Consistency Models for Shared Memory-Multiprocessors* paper as an excellent detailed treatment of this subject.

This appendix does not reproduce such a work, but instead concentrates on some cases that demonstrate the features of the weakly-ordered memory model of the ARM architecture from ARMv6. In particular, the examples show how the use of the DMB and DSB memory barrier instructions can provide the necessary safeguards to limit memory ordering effects at the required synchronization points.

F.1.2 Barrier operation definitions

The following reference, or provide, definitions of terms used in this appendix:

DMB See *Data Memory Barrier (DMB)* on page B2-85.

DSB See *Data Synchronization Barrier (DSB)* on page B2-86.

ISB See *Instruction Synchronization Barrier (ISB)* on page B2-85.

Observer, Completion

See *Observability and completion* on page B2-82.
Program order
The order of instructions as they appear in an assembly language program. This appendix does not attempt to describe or define the legal transformations from a program written in a higher level programming language, such as C or C++, into the machine language that can then be disassembled to give an equivalent assembly language program. Such transformations are a function of the semantics of the higher level language and the capabilities and options on the compiler.

F.1.3 Conventions

Many of the examples are written in a stylized extension to ARM assembler, to avoid confusing the examples with unnecessary code sequences.

AArch32
The construct \texttt{WAIT([Rx]==1)} describes the following sequence:

\begin{verbatim}
loop
  LDR R12, [Rx]
  CMP R12, #1
  BNE loop
\end{verbatim}

Also, the construct \texttt{WAIT\_ACQ([Rx]==1)} describes the following sequence:

\begin{verbatim}
loop
  LDA R12, [Rx] ; load acquire ensures it is ordered before subsequent loads/stores
  CMP R12, #1
  BNE loop
\end{verbatim}

R12 is chosen as an arbitrary temporary register that is not in use. It is named to permit the generation of a false dependency to ensure ordering.

AArch64
The construct \texttt{WAIT([Xx]==1)} describes the following sequence:

\begin{verbatim}
loop
  LDR W12, [Xx]
  CMP W12, #1
  B.NE loop
\end{verbatim}

Also, the construct \texttt{WAIT\_ACQ([Xx]==1)} and describes the following sequence:

\begin{verbatim}
loop
  LDAR W12, [Xx] ; load acquire ensures it is ordered before subsequent loads/stores
  CMP W12, #1
  B.NE loop
\end{verbatim}

For each example, a code sequence is preceded by an identifier of the observer running it:

\begin{itemize}
  \item P0, P1…Px refer to caching coherent PEs that implement the ARMv8 architecture, and are in the same shareability domain.
  \item E0, E1…Ex refer to non-caching observers, that do not participate in the coherency protocol, but execute ARM instructions and have a weakly-ordered memory model. This does not preclude these observers being different objects, such as DMA engines or other system masters.
\end{itemize}

These observers are unsynchronized other than as required by the documented code sequence.
F.1 Introduction

Note

Throughout this appendix, ARM instruction and instruction refer to instructions from the A64, A32, or T32 instruction set, provided by ARMv8 implementations.

Results are expressed in terms of <agent>:<register>, such as P0:R5. The results can be described as:

Permissible
This does not imply that the results expressed are required or are the only possible results. In most cases they are results that would not be possible under a sequentially consistent running of the code sequences on the agents involved. In general terms, this means that these results might be unexpected to anyone unfamiliar with memory consistency issues.

Not permissible
Results that the architecture expressly forbids.

Required
Results that the architecture expressly requires.

The examples omit the required shareability domain arguments of DMB and DSB instructions. The arguments are assumed to be selected appropriately for the shareability domains of the observers.

In AArch32 state, where the barrier function in the litmus test can be achieved by a DMB.ST, that is a barrier to stores only, this is shown by the use of DMB [ST]. This indicates that the ST qualifier can be omitted without affecting the result of the test. In some implementations DMB.ST is faster than DMB.

For AArch64 code, the shareability domain of the DMB or DSB must be included. This is shown in this document using the notation DMB <domain> and DSB <domain> respectively.

Except where otherwise stated, other conventions are:

- All memory initializes to 0.
- R0 and W0 contain the value 1.
- R1 - R4 and W1 - W4 contain arbitrary independent addresses that initialize to the same value on all PEs. The addresses held in these registers are Shareable and:
  - The addresses held in R1 and R2 are in Write-Back Cacheable Normal memory.
  - The address held in R3 is in Write-Through Cacheable Normal memory.
  - The address held in R4 is in Non-cacheable Normal memory.
- R5 - R8 and W5 - W8 contain:
  - When used with an STR instruction, 0x55, 0x66, 0x77, and 0x88 respectively.
  - When used with an LDR instruction, the value 0.
- R11 and W11 contain a new instruction or new translation table entry, as appropriate, and R10 contains the virtual address and the ASID, for use in this change of translation table entry.
- Memory locations are Normal memory locations unless otherwise stated.

The examples use mnemonics for the cache maintenance and TLB maintenance operations. The following tables describe the mnemonics:

- Cache maintenance operations, functional group on page G3-3743
- TLB maintenance operations, functional group on page G3-3744.

Notes on timing effects

The ARMv8 architecture makes no statement about when an instruction will occur. In particular, stores may take an unbounded time to be observed by other observers. Therefore the WAIT loop waiting for the result of that store may take an unbounded time to move forward.

In cases that it is necessary to guarantee the completion of a store, a DSB instruction can be used to force this drain.

In general, the examples in this document associated with ordering assume that stores will become observable over time and so a final DSB barrier to ensure the completion of stores is omitted.
F.2 Load-Acquire, Store-Release and barriers

The Load-Acquire and Store-Release instructions are described in Load-Acquire, Store-Release on page B2-87.

The following sections show that most of the examples in sections Simple ordering and barrier cases on page AppxF-4859 and Load-Exclusive, Store-Exclusive and barriers on page AppxF-4866 can be achieved using the Load-Acquire and Store-Release instructions without the need for additional barriers.

F.2.1 Message passing

The following sections describe:

- Resolving weakly-ordered message passing by using Acquire and Release.
- Resolving message passing by the use of Store-Release and address dependency on page AppxF-4832.

Resolving weakly-ordered message passing by using Acquire and Release

The message passing problem described in Weakly-ordered message passing problem on page AppxF-4859 can be solved by the use of Load-Acquire and Store-Release instructions when accessing the communications flag:

### AArch32

P1

```
STR R5, [R1]          ; set new data
STL R0, [R2]          ; send flag indicating data ready, which is ordered after all
```

P2

```
WAIT_ACQ([R2]==1)     ; wait on flag
LDR R5, [R1]
```

### AArch64

P1

```
STR W5, [X1]          ; set new data
STL W0, [X2]          ; send flag indicating data ready, which is ordered after all
```

P2

```
WAIT_ACQ([X2]==1)     ; wait on flag
LDR W5, [X1]
```

This ensures the observed order of both the reads and the writes allows transfer of data such that the result P2:R5==0x55 is guaranteed.

This approach also works with multiple observers, in a way that further observers use the same sequence as P2 uses:

### AArch32

P3

```
WAIT_ACQ([R2]==1)     ; wait on flag
LDR R5, [R1]
```
Resolving message passing by the use of Store-Release and address dependency

The lack of ordering of stores discussed in Message passing with multiple observers on page AppxF-4861 can be resolved by the use of Store-Release for the store of the valid flag by P1, even when the observers are using an address dependency:

**AArch64**

P1

\[
\text{WAIT\_ACQ([X2]==1)} \quad \text{; wait on flag}
\]

\[
\text{LDR W5, [X1]}
\]

P2

\[
\text{WAIT([X2]==1)}
\]

\[
\text{AND R12, R12, #0} \quad \text{; R12 is destination of LDR in WAIT macro}
\]

\[
\text{LDR W5, [X1, X12]}
\]

This ensures the observed order of the writes allows transfer of data such that P2:R5 and P3:R5 contain the same value of 0x55.

This approach also works with multiple observers, in a way that further observers use the same sequence as P2 uses:

**AArch32**

P1

\[
\text{STR R5, [R1] } \quad \text{; set new data}
\]

\[
\text{STL R0, [R2] } \quad \text{; send flag indicating data ready using a Store Release}
\]

P2

\[
\text{WAIT([R2]==1)}
\]

\[
\text{AND R12, R12, #0} \quad \text{; R12 is destination of LDR in WAIT macro}
\]

\[
\text{LDR R5, [R1, R12]}
\]

This approach also works with multiple observers, in a way that further observers use the same sequence as P2 uses:

**AArch64**

P1

\[
\text{STR W5, [X1] } \quad \text{; set new data}
\]

\[
\text{STLR W0, [X2] } \quad \text{; send flag indicating data ready using a Store Release}
\]

P2

\[
\text{WAIT([X2]==1)}
\]

\[
\text{AND W12, W12, WZR} \quad \text{; W12 is destination of LDR in WAIT macro}
\]

\[
\text{LDR W5, [X1, X12]}
\]
Appendix F Barrier Litmus Tests

F.2 Load-Acquire, Store-Release and barriers

AArch64

P3
WAIT([X2]==1)

AND W12, W12, WZR  ; R12 is destination of LDR in WAIT macro
LDR W5, [X1, X12]  ; Load is dependent and so is ordered after the flag has been seen

F.2.2 Address dependency with object construction

When accessing an object-oriented data structure, the address dependency rule means that barriers are not required, even when initializing the object. A Store-Release can be used to ensure the order of the update of the base address:

AArch32

P1

STR R5, [R1, #offset]  ; set new data in a field
STL R1, [R2]          ; update base address

P2

LDR R1, [R2]          ; read for base address
CMP R1, #0            ; check if it is valid
BEQ null_trap
LDR R5, [R1, #offset] ; use base address to read field

AArch64

P1

STR W5, [X1, #offset] ; set new data in a field
STLR X1, [X2]         ; update base address

P2

LDR X1, [X2]          ; read for base address
CMP X1, #0            ; check if it is valid
B.EQ null_trap
LDR W5, [X1, #offset] ; use base address to read field

It is required that P2:R5==0x55 if the null_trap is not taken. This avoids P2 observing a partially constructed object from P1. Significantly, P2 does not need a barrier to ensure this behavior.

The read of the base address in P2 could be a Load-Acquire, but it is not necessary in this case.
F.2.3 Causal consistency issues with multiple observers

The cause consistent problem discussed in Causal consistency issues with multiple observers on page AppxF-4862 can be addressed by the use of a Store-Release, as this requires that the store is multicopy atomic in the case of a Load-Acquire. In addition, a Store-Release has an effect on the observation order of any stores observed by the observer executing the Store-Release.

The following sequences guarantee causal consistency:

- **Using multi-copy atomicity of the Store-Release when observed by Load-Acquire.**
- **Using ordering property of Store-Release on stores observed by the PE on page AppxF-4835.**

### Using multi-copy atomicity of the Store-Release when observed by Load-Acquire

**AArch32**

**P1**

```assembly
STL R0, [R2]          ; set new data
; this is made multi-copy atomic
```

**P2**

```assembly
WAIT_ACQ([R2]==1)     ; wait to see new data from P1
STR R0, [R3]          ; send flag
; must be after the new data has been by P2 as stores must not be speculative
; this does not need to be a store release, though it could be a store release
```

**P3**

```assembly
WAIT([R3]==1)         ; wait for P2 flag
; this does not need to be a WAIT_ACQ, although
; it could be a WAIT_ACQ (at which point the dependency is not needed)
AND R12, R12, #0      ; dependency to ensure order (only needed for a WAIT, not WAIT_ACQ)
LDA R0, [R2, R12]     ; read P1 data using a Load-Acquire
```

**AArch64**

**P1**

```assembly
STLR W0, [X2]         ; set new data
; this is made multi-copy atomic
```

**P2**

```assembly
WAIT_ACQ([X2]==1)     ; wait to see new data from P1
STR W0, [X3]          ; send flag
; must be after the new data has been by P2 as stores
; must not be speculative
; this does not need to be a store release, though it could be a store release
```

**P3**

```assembly
WAIT([X3]==1)         ; wait for P2 flag
; this does not need to be a WAIT_ACQ, though
```
Appendix F Barrier Litmus Tests
F.2 Load-Acquire, Store-Release and barriers

Using ordering property of Store-Release on stores observed by the PE

AArch32

P1

STR R0, [R2] ; set new data
; this does not have to be a store release, though it
; could be a store release

P2

WAIT ([R2]==1) ; wait to see new data from P1
; this does not need to be a WAIT_ACQ, though it could be a WAIT_ACQ
STL R0, [R3] ; send flag
; must be after the new data has been by P2 as stores must not be speculative
; as a store release, this orders P1 store

P3

WAIT([R3]==1) ; wait for P2 flag
; this does not need to be a WAIT_ACQ, although it could be a WAIT_ACQ
; (at which point the dependency is not needed)
AND R12, R12, #0 ; dependency to ensure order (only needed for a WAIT, not WAIT_ACQ)
LDR R0, [R2, R12] ; read P1 data

AArch64

P1

STR W0, [X2] ; set new data
; this does not have to be a store release, though it
; could be a store release

P2

WAIT ([X2]==1) ; wait to see new data from P1
; this does not need to be a WAIT_ACQ, though it could be a WAIT_ACQ
STLR W0, [X3] ; send flag
; must be after the new data has been by P2 as stores must not be speculative
; as a store release, this orders P1 store

P3

WAIT([X3]==1) ; wait for P2 flag
; this does not need to be a WAIT_ACQ, though it could be a WAIT_ACQ
F.2 Load-Acquire, Store-Release and barriers

; at which point the dependency is not needed
AND W12, W12, WZR  ; dependency to ensure order
; only needed for a WAIT, not WAIT_ACQ
LDR W0, [X2, X12]  ; read P1 data

In this case, P3:R0 == 0 is not permissible. P3 is guaranteed to see the store from P1 if P2 has seen the store from P1 using a Load-Acquire.

Note
The use of dependency by P3 could be replaced by a Load-Acquire.

F.2.4 Multiple observers of writes to multiple locations

The ARM weakly consistent memory model means that different observers can observe writes to different locations in different orders as was shown in Multiple observers of writes to multiple locations on page AppxF-4863, but the use of Load-Acquire and Store-Release can resolve this. In this case, the loads by P3 and P4 must be Load-Acquire in order to ensure the perceived multi-copy atomicity of the stores:

AArch32

P1
STL R0, [R1]  ; set new data

P2
STL R0, [R2]  ; set new data

P3
LDA R10, [R2]  ; read P2 data before P1
LDA R9, [R1]  ;
BIC R9, R10, R9  ; R9 <- R10 & ~R9
; R9 contains 1 if read from [R2] is observed to be 1 and
; read from [R1] is observed to be 0

P4
LDA R9, [R1]
LDA R10, [R2]
BIC R9, R9, R10  ; R9 <- R9 & ~R10
; R9 contains 1 if read from [R2] is observed to be 0 and
; read from [R1] is observed to be 1

AArch64

P1
STLR W0, [X1]  ; set new data

P2
STLR W0, [X2]  ; set new data

P3
LDAR W10, [X2]  ; read P2 data before P1
Appendix F Barrier Litmus Tests

F.2 Load-Acquire, Store-Release and barriers

LDAR W9, [X1] ;
BIC W9, W10, W9 ; W9 <- W10 & ~W9
; W9 contains 1 if read from [X2] is observed to be 1 and read from [X1] is observed to be 0

P4

LDAR W9, [X1]
LDAR W10, [X2]
BIC W9, W9, W10 ; W9 <- W9 & ~W10
; W9 contains 1 if read from [X2] is observed to be 0 and read from [X1] is observed to be 1

In this case, the result P3:R9==1 and P4:R9==1 is not permissible, as the stores from P1 and P2 are multi-copy atomic when read by Load-Acquire.

Therefore, if P3 gets R10==1, then we know that the P3 load of R9 can only be observed after we know that P4 has also observed the P2 store to [R2]. Similarly, if the P4 load of R9 returns 1, and the P3 load of R9 returns 0, then the P3 load must have occurred before the P4 load.

Therefore, if the P3 load of R10 returns 1 and the P3 load of R9 returns 0, then we know that if the P4 load of R9 returns 1, it must have happened after P4 has observed the P2 store to [R2], so the P4 load of R10 must return 1.

This shows that, of the 4 possible values for {P3:R9, P4:R9}, the use of these instructions makes the result {1,1} impossible.

F.2.5 WFE and WFI and barriers

The Wait For Event and Wait For Interrupt instructions permit the PE to suspend execution and enter a low-power state. An explicit DSB barrier instruction is required if it is necessary to ensure memory accesses made before the WFI or WFE are visible to other observers, unless some other mechanism has ensured this visibility. Examples of other mechanism that would guarantee the required visibility are the DSB described in Posting a store before polling for acknowledgement on page AppxF-4864, or a dependency on a load.

The following example requires the DSB to ensure that the store is visible:

AArch32
P1
STR R0, [R2]
DSB
Loop
  WFI
  B Loop
AArch64
P1
STR W0, [X2]
DSB <domain>
Loop
WFI

B Loop

This requirement is unchanged in ARMv8 by the presence of Load-Acquire or Store-Release.
F.3 Load-Acquire Exclusive, Store-Release Exclusive and barriers

The ARMv8 architecture adds the acquire and release semantics to Load-Exclusive and Store-Exclusive instructions, which allows them to gain ordering acquire and/or release semantics.

The Load-Exclusive instruction can be specified to have acquire semantics, and the Store-Exclusive instruction can be specified to have release semantics. These can be arbitrarily combined to allow the atomic update created by a successful Load-Exclusive and Store-Exclusive pair to have any of:

- No Ordering semantics (using LDREX and STREX).
- Acquire only semantics (using LDAEX and STREX).
- Release only semantics (using LDREX and STLEX).
- Sequentially consistent semantics (using LDAEX and STLEX).

In addition, the ARMv8 specification requires that the clearing of a global monitor will generate an event for the PE associated with the global monitor, which can simplify the use of WFE, by removing the need for a DSB barrier and SEV instruction.

F.3.1 Acquiring a lock

A common use of Load-Exclusive and Store-Exclusive instructions is to claim a lock to permit entry into a critical region. This is typically performed by testing a lock variable that indicates 0 for a free lock and some other value, commonly 1 or an identifier of the process holding the lock.

For a critical region, the requirement on taking a lock is usually for acquire semantics, while the clearing of a lock requires release semantics:

**AArch32**

```
Px
    PLDW[R1]  ; preload into cache in unique state
Loop
    LDAEX R5, [R1]  ; read lock with acquire
    CMP R5, #0      ; check if 0
    STREXEQ R5, R0, [R1]  ; attempt to store new value
    CMPEQ R5, #0    ; test if store succeeded
    BNE Loop       ; retry if not
```

; loads and stores in the critical region can now be performed

**AArch64**

```
Px
    PRFM PSTL1KEEP, [X1]  ; preload into cache in unique state
Loop
    LDAXR W5, [X1]  ; read lock with acquire
    CBNZ W5, Loop   ; check if 0
    STXR W5, W0, [X1]  ; attempt to store new value
    CBNZ W5, Loop   ; test if store succeeded and retry if not
```

; loads and stores in the critical region can now be performed
The acquire associated with the load is sufficient to ensure the required ordering in a lock situation. The Store-Exclusive will fail (and so be retried) if there is a store to the location being monitored between the Load-Exclusive and the Store-Exclusive.

### F.3.2 Releasing a lock

The converse operation of releasing a lock does not require the use of Load-Exclusive and Store-Exclusive instructions, because only a single observer is able to write to the lock. However, often it is necessary for any observer to observe any memory updates, or any values that are loaded into memory, before they observe the release of the lock. Therefore, the lock release needs release semantics:

**AArch32**

```assembly
Px
; loads and stores in the critical region
MOV R0, #0
STL R0, [R1] ; clear the lock with release semantics
```

**AArch64**

```assembly
Px
; loads and stores in the critical region
STLR WZR, [X1] ; clear the lock with release semantics
```

### F.3.3 Ticket locks

When a lock is free, in order to avoid a rush to get the lock by many PEs, the use of ticket locks is common in more advanced systems. When the use is requested, the ticket locks determine the order of the users of the critical sections, in order to avoid starvation that can occur with a simple contention-based spin lock.

A ticket lock allocates each thread a ticket number when it first requests the lock, and then compares that number with the current number for the lock. If they are the same, then the critical section can be entered. Otherwise the thread waits until the current number is equal to the ticket number for that thread.

The reading of the current number of the lock needs acquire semantics for the lock to be acquired.

--- **Note** ---

The code in this section is little-endian code, as it views the combined current and next values as a single combined quantity. The addresses of the current and next ticket values need to be adjusted for a big-endian system.

---

This is shown in the implementation below:

**AArch32**

```assembly
Px
; R1 holds two 16 bit quantities
; the lower halfword holds the current ticket number
; the higher halfword holds the next ticket number

PLDW[R1] ; preload into cache in unique state
Loop1
LDAEX RS, [R1] ; read current and next
```
ADD R5, R5, #0x10000 ; increment the next number
STREX R6, R5, [R1] ; and update the value
CMP R6, #0 ; did the exclusive pass
BNE Loop1 ; retry if not
CMP R5, R5, ROR #16 ; is the current ticket ours
BEQ block_start

Loop2
LDAH R6, [R1] ; read current value
CMP R6, R5, LSR #16 ; compare it with our allocated ticket
BNE Loop2 ; retry (spin) if it is not the same

block_start

AArch64

X1 holds 2 16 bit quantities
; the lower halfword holds the current ticket number
; the higher halfword holds the next ticket number

PRFM PSTL1KEEP, [X1] ; preload into cache in unique state

Loop1
LDAXR W5, [X1] ; read current and next
ADD W5, W5, #0x10000 ; increment the next number
STXR W6, W5, [X1] ; and update the value
CBNZ W6, Loop1 ; did the exclusive pass – retry if not

AND W6, W5, #0xFFFF
CMP W6, W5, LSR #16 ; is the current ticket ours
B.EQ block_start

Loop2
LDARH W6, [X1] ; read current value
CMP W6, W5, LSR #16 ; compare it with the our allocated ticket
B.NE Loop2 ; retry (spin) if it isn't the same

block_start

Releasing the ticket lock simply involves incrementing the current ticket number, that is still assumed to be in R3, and doing a Store-Release:

AArch32

ADD R6, R6, #1
F.3 Load-Acquire Exclusive, Store-Release Exclusive and barriers

F.3.4 Use of Wait For Event (WFE) and Send Event (SEV) with locks

The ARMv8 architecture can use the Wait For Event mechanism to minimise the energy cost of polling variables by putting the PE into a low power state, suspending execution, until an asynchronous exception or an explicit event is seen by that PE. In ARMv8, the event can be generated as a result of clearing the global monitor, so removing the need for a DSB barrier or an explicit send event message.

This can be used with simple locks or with ticket locks.

Simple lock

The following is an example of lock acquire code using WFE:

**AArch32**

```assembly
Px
PLDW[R1]            ; preload into cache in unique state
Loop
LDAEX RS, [R1]      ; read lock with acquire
CMP RS, #0          ; check if 0
WFENE               ; sleep if the lock is held
STRESEQ RS, R0, [R1] ; attempt to store new value
CMPEQ RS, #0        ; test if store succeeded
BNE Loop            ; retry if not
```

**AArch64**

```assembly
Px
SEVL                ; invalidates the WFE on the first loop iteration
PRFM PSTL1KEEP, [X1] ; allocate into cache in unique state
Loop
WFE
LDAXR WS, [X1]      ; read lock with acquire
CBNZ WS, Loop       ; check if 0
STXR WS, W0, [X1]   ; attempt to store new value
CBNZ WS, Loop       ; test if store succeeded and retry if not
```

; loads and stores in the critical region can now be performed

And the following is an example of lock release code:

**AArch32**
Fx

; loads and stores in the critical region
MOV R0, #0
STL R0, [R1] ; clear the lock

AArch64

Fx

; loads and stores in the critical region
STLR WZR, [X1] ; clear the lock

Ticket lock

In the Ticket lock case, the Load-Exclusive instruction can be used to move the monitor into the exclusive state for
the express purpose of creating an event when the monitor changes state:

AArch32

Fx

; R1 holds 2 16 bit quantities
; the lower halfword holds the current ticket number
; the higher halfword holds the next ticket number
PLDW[R1] ; preload into cache in unique state
Loop1
LDAEX R5, [R1] ; read current and next
ADD R5, R5, #0x10000 ; increment the next number
STREX R6, R5, [R1] ; and update the value
CMP R6, #0 ; did the exclusive pass
BNE Loop ; retry if not
CMP R5, R5, ROR #16 ; is the current ticket ours
BEQ block_start
SEVL
Loop2
WFE ; wait if there has not been a change to the count since last
; read
LDAEXH R6, [R1] ; check the current count
CMP R6, R5, LSR #16 ; check if it is equal
BNE Loop2
block_start

AArch64

Fx

; X1 holds 2 16 bit quantities
; the lower halfword holds the current ticket number
; the higher halfword holds the next ticket number
PRFM PSTLKEEP, [X1] ; preload into cache in unique state
Loop1
LDAEX R5, [X1] ; read current and next
ADD R5, W5, #0x10000 ; increment the next number
STXR W6, W5, [X1] ; and update the value
CBNZ W6, Loop1 ; did the exclusive pass – retry if not
AND W6, W5, 0xFFFF
CMP W6, W5, LSR #16 ; is the current ticket ours
B.EQ block_start
  SEVL
Loop2
  WFE
  LDAXRH W6, [X1] ; read current value
  CMP W6, W5, LSR #16 ; compare it with our allocated ticket
  B.NE Loop2 ; retry (spin) if it is not the same
block_start
Using a mailbox to send an interrupt

In some message passing systems, it is common for one observer to update memory and then notify a second observer of the update by sending an interrupt, using a mailbox.

Although a memory access might be made to initiate the sending of the mailbox interrupt, a DSB instruction is required to ensure the completion of previous memory accesses.

Therefore, the following sequence is required to ensure that P2 observes the updated value:

**AArch32**

P1

```assembly
STR R5, [R1]          ; message stored to shared memory location
DSB ST
STR R0, [R4]          ; R4 contains the address of a mailbox
```

P2

; interrupt service routine

```assembly
LDR R5, [R1]
```

**AArch64**

P1

```assembly
STR W5, [X1]          ; message stored to shared memory location
DSB ST
STR W0, [X4]          ; R4 contains the address of a mailbox
```

P2

; interrupt service routine

```assembly
LDR W5, [X1]
```

These rules are required in connection to the ARM Generic Interrupt Controller (GIC).
F.5 Cache and TLB maintenance operations and barriers

The following sections describe the use of barriers with cache and TLB maintenance operations:

- Data cache maintenance operations
- Instruction cache maintenance operations on page AppxF-4851
- TLB maintenance operations and barriers on page AppxF-4854.

F.5.1 Data cache maintenance operations

The following sections describe the use of barriers with data cache maintenance operations:

- Message passing to non-caching observers
- Multiprocessing message passing to non-caching observers on page AppxF-4847
- Invalidating DMA buffers, non-functional example on page AppxF-4848
- Invalidating DMA buffers, functional example with single PE on page AppxF-4849
- Invalidating DMA buffers, functional example with multiple coherent PEs on page AppxF-4850.

Message passing to non-caching observers

The ARMv8 architecture requires the use of DMB instructions to ensure the ordering of data cache maintenance operations and their effects. The Load-Acquire and Store-Release instructions have no effect on cache maintenance operation. This means the following message passing approaches can be used when communicating between caching observers and non-caching observers:

AArch32

P1

STR R5, [R1] ; update data (assumed to be in P1 cache)
DCCMVAC R1 ; clean cache to point of coherency
DMB ; ensure effects of the clean will be observed before the
     ; flag is set
STR R0, [R4] ; send flag to external agent (Non-cacheable location)

E1

WAIT_ACQ ([R4] == 1) ; wait for the flag (with order)
LDR R5, [R1] ; read the data

AArch64

P1

STR W5, [X1] ; update data (assumed to be in P1 cache)
DC CVAC, X1 ; clean cache to point of coherency
DMB ISH ; ensure effects of the clean will be observed before the
     ; flag is set
STR W0, [X4] ; send flag to external agent (Non-cacheable location)

E1

WAIT_ACQ ([X4] == 1) ; wait for the flag (with order)
LDR W5, [X1] ; read the data

In this example, it is required that E1:R5==0x55.
Multiprocessing message passing to non-caching observers

The broadcast nature of the cache maintenance operations combined with properties of barriers, means that the message passing principle for non-caching observers is:

**AArch32**

**P1**

```assembly
STR R5, [R1]          ; update data (assumed to be in P1 cache)
STL R0, [R2]          ; send a flag for P2 (ordered by the store release)
```

**P2**

```assembly
WAIT ([R2] == 1)      ; wait for P1 flag
DMB                   ; ensure cache clean is observed after P1 flag is observed
DCMVAC R1            ; clean cache to point of coherency ?will clean P1 cache
DMB                   ; ensure effects of the clean will be observed before the
                      ; flag to E1 is set
STR R0, [R4]          ; send flag to E1
```

**E1**

```assembly
WAIT_ACQ ([R4] == 1) ; wait for P2 flag (ordered)
LDR R5, [R1]          ; read data
```

**AArch64**

**P1**

```assembly
STR W5, [X1]          ; update data (assumed to be in P1 cache)
STLR W0, [X2]         ; send a flag for P2 (ordered)
```

**P2**

```assembly
WAIT ([X2] == 1)      ; wait for P1 flag
DMB SY                ; ensure cache clean is observed after P1 flag is observed
DC CVAC, X1           ; clean cache to point of coherency, will clean P1 cache
DMB SY                ; ensure effects of the clean will be observed before the
                      ; flag to E1 is set
STR W0, [X4]          ; send flag to E1
```

**E1**

```assembly
WAIT_ACQ ([X4] == 1) ; wait for P2 flag
LDR W5, [X1]          ; read data
```

In this example, it is required that E1:R5==0x55. The clean operation executed by P2 affects the data location in the P1 cache. The cast-out from the P1 cache is guaranteed to be observed before P2 updates [R4].
Note
The cache maintenance operations are not ordered by the Load-Acquire and Store-Release instructions.

Invalidating DMA buffers, non-functional example

The basic scheme for communicating with an external observer that is a process that passes data in to a Cacheable memory region must take account of the architectural requirement that regions marked as Cacheable can be allocated into a cache at any time, for example as a result of speculation. The following example shows this possibility:

**AArch32**

P1

DCIMVAC R1 ; ensure cache clean wrt memory. A clean operation could be used
; but as the DMA will subsequently overwrite this region an
; invalidate operation is sufficient and usually more efficient
DMB ; ensures cache invalidation is observed before the next store
; is observed
STR R0, [R3] ; send flag to external agent
WAIT_ACQ ([R4]==1) ; wait for a different flag from an external agent
LDR R5, [R1]

E1

WAIT ([R3] == 1) ; wait for flag
STR R5, [R1] ; store new data
STL R0, [R4] ; send a flag

**AArch64**

P1

DC IVAC, X1 ; ensure cache clean wrt memory. A clean operation could be used
; but as the DMA will subsequently overwrite this region an
; invalidate operation is sufficient and usually more efficient
DMB SY ; ensures cache invalidation is observed before the next store
; is observed
STR W0, [X3] ; send flag to external agent
WAIT_ACQ ([X4]==1) ; wait for a different flag from an external agent
LDR W5, [X1]

E1

WAIT ([X3] == 1) ; wait for flag
STR W5, [X1] ; store new data
STLR W0, [X4] ; send a flag

If a speculative access occurs, there is no guarantee that the cache line containing [R1] is not brought back into the cache after the cache invalidation, but before [R1] is written by E1. Therefore, the result P1:R5=0 is permissible.
Invalidating DMA buffers, functional example with single PE

**AArch32**

P1

```
DCIMVAC R1            ; ensure cache clean wrt memory. A clean operation could be used
; but as the DMA will subsequently overwrite this region an
; invalidate operation is sufficient and usually more efficient
DMB                   ; ensures cache invalidation is observed before the next store
; is observed
STR R0, [R3]          ; send flag to external agent
WAIT ([R4]==1)        ; wait for a different flag from an external agent
DMB                   ; ensure that cache invalidate is observed after the flag
; from external agent is observed
DCIMVAC R1            ; ensure cache discards stale copies before use
LDR R5, [R1]
```

E1

```
WAIT ([R3] == 1)      ; wait for flag
STR R5, [R1]          ; store new data
STL R0, [R4]          ; send a flag
```

**AArch64**

P1

```
DC IVAC, X1           ; ensure cache clean wrt memory. A clean operation could be used
; but as the DMA will subsequently overwrite this region an
; invalidate operation is sufficient and usually more efficient
DMB SY                ; ensures cache invalidation is observed before the next store
; is observed
STR W0, [X3]          ; send flag to external agent
WAIT ([X4]==1)        ; wait for a different flag from an external agent
DMB SY                ; ensure that cache invalidate is observed after the flag
; from external agent is observed
DC IVAC, X1           ; ensure cache discards stale copies before use
LDR W5, [X1]
```

E1

```
WAIT ([X3] == 1)      ; wait for flag
STR W5, [X1]          ; store new data
STLR W0, [X4]         ; send a flag
```

In this example, the result P1:R5 == 0x55 is required. Including a cache invalidation after the store by E1 to [R1] is observed ensures that the line is fetched from external memory after it has been updated.
Invalidate DMA buffers, functional example with multiple coherent PEs

The broadcasting of cache maintenance operations, and the use of DMB instructions to ensure their observability, means that the previous example extends naturally to a multiprocessor system. Typically this requires a transfer of ownership of the region that the external observer is updating.

**AArch32**

**P0**

(Use data from [R1], potentially using [R1] as scratch space)

STL R0, [R2] ; signal release of [R1]

WAIT_ACQ ([R2] == 0) ; wait for new value from DMA

LDR R5, [R1]

**P1**

WAIT ([R2] == 1) ; wait for release of [R1] by P0

DCIMVAC R1 ; ensure caches are clean wrt memory, invalidate is sufficient

DMB

STR R0, [R3] ; request new data for [R1]

WAIT ([R4] == 1) ; wait for new data

DMB

DCIMVAC R1 ; ensure caches discard stale copies before use

DMB

MOV R0, #0

STR R0, [R2] ; signal availability of new [R1]

**E1**

WAIT ([R3] == 1) ; wait for new data request

STR R5, [R1] ; send new [R1]

DMB [ST]

STR R0, [R4] ; indicate new data available to P1

**AArch64**

**P0**

(Use data from [X1], potentially using [X1] as scratch space)

STLR W0, [X2] ; signal release of [X1]

WAIT_ACQ ([X2] == 0) ; wait for new value from DMA

LDR W5, [X1]

**P1**

WAIT ([X2] == 1) ; wait for release of [R1] by P0

DC IMVAC, X1 ; ensure caches are clean wrt memory, invalidate is sufficient

DMB SY

STR W0, [X3] ; request new data for [R1]

WAIT ([X4] == 1) ; wait for new data
Appendix F Barrier Litmus Tests

F.5 Cache and TLB maintenance operations and barriers

F.5.1 Cache and TLB maintenance operations

In this example, the result P0:R5 == 0x55 is required. The DMB issued by P1 after the first data cache invalidation ensures that effect of the cache invalidation on P0 is seen by E1 before the store by E1 to [R1]. The DMB issued by P1 after the second data cache invalidation ensures that its effects are seen before the store of 0 to the semaphore location in [R2].

F.5.2 Instruction cache maintenance operations

The following sections describe the use of barriers with instruction cache maintenance operations:

• Ensuring the visibility of updates to instructions for a uniprocessor
• Ensuring the visibility of updates to instructions for a multiprocessor on page AppxF-4852.

Ensuring the visibility of updates to instructions for a uniprocessor

On a single PE, the agent that causes instruction fetches, or instruction cache linefills, is a separate memory system observer from the agent that causes data accesses. Therefore, any operations to invalidate the instruction cache can rely only on seeing updates to memory that are complete. This must be ensured by the use of a DSB instruction.

Also, instruction cache maintenance operations are only guaranteed to complete after the execution of a DSB, and an ISB is required to discard any instructions that might have been prefetched before the instruction cache invalidation completed. Therefore, on a uniprocessor, to ensure the visibility of an update to code and to branch to it, the following sequence is required:

AArch32

P1

STR R11, [R1] ; R11 contains a new instruction to stored in program memory
DCOMVAU R1 ; clean to PoU makes visible to instruction cache
DSB
ICIMVAU R1 ; ensure instruction cache/branch predictor discard stale data
BPIMVA R1
DSB ; ensure completion of the invalidation
ISB ; ensure instruction fetch path sees new I cache state
BX R1

In AArch64, the branch predictor maintenance is not required.

AArch64

P1

STR W11, [X1] ; W11 contains a new instruction to stored in program memory
DC CVAU, X1 ; clean to PoU makes visible to instruction cache
Appendix F Barrier Litmus Tests
F.5 Cache and TLB maintenance operations and barriers

---

**DSB ISH**

IC IVAU, X1 ; ensure instruction cache/branch predictor discard stale data

**DSB ISH** ; ensure completion of the invalidation

**ISB** ; ensure instruction fetch path sees new I cache state

**BR X1**

---

**Note**

Where the changes to the instructions span multiple cache lines, then the data cache and instruction cache maintenance instructions can be duplicated to cover each of the lines to be cleaned and to be invalidated.

---

Ensuring the visibility of updates to instructions for a multiprocessor

The ARMv8 architecture requires a PE that performs an instruction cache maintenance operation to execute a DSB instruction to ensure completion of the maintenance operation. This ensures that the cache maintenance operation is complete on all PEs in the Inner Shareable shareability domain.

An ISB is not broadcast, and so does not affect other PEs. This means that any other PE must perform its own ISB synchronization after it knows that the update is visible, if it is necessary to ensure its synchronization with the update. The following example shows how this might be done:

**AArch32**

**P1**

STR R11, [R1] ; R11 contains a new instruction to stored in program memory

DCOMVAU R1 ; clean to PoU makes visible to instruction cache

DSB ; ensure completion of the clean on all processors

ICIMVAU R1 ; ensure instruction cache/branch predictor discard stale data

BPIMVA R1

DSB ; ensure completion of the ICache and branch predictor

; invalidation on all processors

STR R0, [R2] ; set flag to signal completion

ISB ; synchronize context on this processor

BX R1 ; branch to new code

**P2-Px**

WAIT ([R2] == 1) ; wait for flag signalling completion

ISB ; synchronize context on this processor

BX R1 ; branch to new code

**AArch64**

**P1**

STR X11, [X1] ; X11 contains a new instruction to stored in program memory

DC CVAU, X1 ; clean to PoU makes visible to instruction cache

DSB ISH ; ensure completion of the clean on all processors

IC IVAU, X1 ; ensure instruction cache/branch predictor discard stale data

DSB ISH ; ensure completion of the ICache and branch predictor
Appendix F Barrier Litmus Tests
F.5 Cache and TLB maintenance operations and barriers

ARM DDI 0487A
Copyright © 2013 ARM Limited. All rights reserved.
Non-Confidential - Beta

; invalidation on all processors
STR W0, [X2] ; set flag to signal completion
ISB ; synchronize context on this processor
BR R1 ; branch to new code

P2-Px
WAIT ([X2] == 1) ; wait for flag signalling completion
ISB ; synchronize context on this processor
BR X1 ; branch to new code

Nonfunctional approach

The following sequence does not have the same effect, because a DSB is not required to complete the instruction cache maintenance operations that other PEs issue:

AArch32
P1
STR R11, [R1] ; R11 contains a new instruction to stored in program memory
DCCMVAU R1 ; clean to PoU makes visible to instruction cache
DSB ; ensure completion of the clean on all processors
ICIMVAU R1 ; ensure instruction cache/branch predictor discard stale data
BPIMVA R1
DSB ; ensure ordering of the store after the invalidation
; DOES NOT guarantee completion of instruction cache/branch predictor on other processors
STR R0, [R2] ; set flag to signal completion
DSB ; ensure completion of the invalidation on all processors
ISB ; synchronize context on this processor
BX R1 ; branch to new code

P2-Px
WAIT ([R2] == 1) ; wait for flag signalling completion
DSB ; this DSB does not guarantee completion of P1
; ICIMVAU/BPIMVA
ISB
BX R1

AArch64
P1
STR W11, [X1] ; W11 contains a new instruction to stored in program memory
DC CVAU, X1 ; clean to PoU makes visible to instruction cache
DSB ISH ; ensure completion of the clean on all processors
IC IVAU, X1 ; ensure instruction cache/branch predictor discard stale data
F.5 Cache and TLB maintenance operations and barriers

F.5.3 TLB maintenance operations and barriers

The following sections describe the use of barriers with TLB maintenance operations:

- Ensuring the visibility of updates to translation tables for a uniprocessor
- Ensuring the visibility of updates to translation tables for a multiprocessor on page AppxF-4855
- Paging memory in and out on page AppxF-4856.

Ensuring the visibility of updates to translation tables for a uniprocessor

On a single PE, the agent that causes translation table walks is a separate memory system observer from the agent that causes data accesses. Therefore, any operations to invalidate the TLB can only rely on seeing updates to memory that are complete. This must be ensured by the use of a DSB instruction.

The ARMv8 architecture requires that translation table walks look in the data or unified caches at L1, so such systems do not require data cache cleaning.

After the translation tables update, any old copies of entries that might be held in the TLBs must be invalidated. This operation is only guaranteed to affect all instructions, including instruction fetches and data accesses, after the execution of a DSB and an ISB. Therefore, the code for updating a translation table entry is:

**AArch32**

P1

\[
\begin{align*}
\text{STR} & \ R11, [R1] \quad ; \text{update the translation table entry} \\
\text{DSB} & \quad ; \text{ensure visibility of the update to translation table walks} \\
\text{TLBIMVA} & \ R10 \\
\text{BPIALL} \\
\text{DSB} & \quad ; \text{ensure completion of the BP and TLB invalidation} \\
\text{ISB} & \quad ; \text{synchronise context on this processor} \\
\end{align*}
\]

; new translation table entry can be relied upon at this point and all accesses
; generated by this observer using
; the old mapping have been completed

In this example, \( P2 \ldots P_x \) might not see the updated region of code at \( R1 \).
### AArch64

#### P1

- `STR X11, [X1]` ; update the translation table entry
- `DSB ISH` ; ensure visibility of the update to translation table walks
- `TLBI VAE1, X10` ; assumes we are in the EL1
- `DSB ISH` ; ensure completion of the TLB invalidation
- `ISB` ; synchronise context on this processor

; new translation table entry can be relied upon at this point and all accesses
; generated by this observer using
; the old mapping have been completed

Importantly, by the end of this sequence, all accesses that used the old translation table mappings have been observed by all observers.

An example of this is where a translation table entry is marked as invalid. Such a system must provide a mechanism to ensure that any access to a region of memory being marked as invalid has completed before any action is taken as a result of the region being marked as invalid.

### Ensuring the visibility of updates to translation tables for a multiprocessor

The same code sequence can be used in a multiprocessing system. The ARMv8 architecture requires a PE that performs a TLB maintenance operation to execute a `DSB` instruction to ensure completion of the maintenance operation. This ensures that the TLB maintenance operation is complete on all PEs in the Inner Shareable shareability domain.

The completion of a `DSB` that completes a TLB maintenance operation ensures that all accesses that used the old mapping have completed.

### AArch32

#### P1

- `STR R11, [R1]` ; update the translation table entry
- `DSB` ; ensure visibility of the update to translation table walks
- `TLBIMVAIS R10`;
- `BPIMVAIS`
- `DSB` ; ensure completion of the BP and TLB invalidation
- `ISB` ; Note ISB is not broadcast and must be executed locally
    ; on other processors

; new translation table entry can be relied upon at this point and all accesses
; generated by any observers affected by the broadcast TLBIMVAIS operation using
; the old mapping have been completed

### AArch64

#### P1

- `STR X11, [X1]` ; update the translation table entry
- `DSB ISH` ; ensure visibility of the update to translation table walks
- `TLBI VAE1IS, X10`
Appendix F Barrier Litmus Tests

F.5 Cache and TLB maintenance operations and barriers

DSB ISH               ; ensure completion of the TLB invalidation
ISB                   ; Note ISB is not broadcast and must be executed locally
; on other processors
; new translation table entry can be relied upon at this point and all accesses
; generated by any observers affected by the broadcast TLBIMVAIS operation using
; the old mapping have been completed

The completion of the TLB maintenance operation is guaranteed only by the execution of a DSB by the observer that
performed the TLB maintenance operation. The execution of a DSB by a different observer does not have this effect,
even if the DSB is known to be executed after the TLB maintenance operation is observed by that different observer.

Paging memory in and out

In a multiprocessor system there is a requirement to ensure the visibility of translation table updates when paging
regions of memory into RAM from a backing store. This might, or might not, also involve paging existing locations
in memory from RAM to a backing store. In such situations, the operating system selects one or more pages of
memory that might be in use but are suitable to discard, with or without copying to a backing store, depending on
whether or not the region of memory is writable. Disabling the translation table mappings for a page, and ensuring
the visibility of that update to the translation tables, prevents agents accessing the page.

For this reason, it is important that the DSB that is performed after the TLB invalidation ensures that no other updates
to memory using those mappings are possible.

An example sequence for the paging out of an updated region of memory, and the subsequent paging in of memory,
is as follows:

AArch32

P1

STR R11, [R1]         ; update the translation table for the region being paged out
DSB                   ; ensure visibility of the update to translation table walks
TLBIMVAIS R10         ; invalidate the old entry
DSB                   ; ensure completion of the invalidation on all processors
ISB                   ; ensure visibility of the invalidation
BL SaveMemoryPageToBackingStore
BL LoadMemoryFromBackingStore
DSB                   ; ensure completion of the memory transfer (this could be part of
; LoadMemoryFromBackingStore
ICIALLUIS             ; also invalidates the branch predictor
STR R9, [R1]          ; create a new translation table entry with a new mapping
DSB                   ; ensure completion of the I Cache & Branch Predictor invalidation
; AND ensure visibility of the new translation table mapping
ISB                   ; ensure synchronisation of this instruction stream

AArch64

P1

STR X11, [X1]         ; update the translation table for the region being paged out
DSB ISH               ; ensure visibility of the update to translation table walks
F.5 Cache and TLB maintenance operations and barriers

```
TLBI VAE1IS, X10 ; invalidate the old entry
DSB ISH ; ensure completion of the invalidation on all processors
ISB ; ensure visibility of the invalidation
BL SaveMemoryPageToBackingStore
BL LoadMemoryFromBackingStore
DSB ISH ; ensure completion of the memory transfer (this could be part of
; LoadMemoryFromBackingStore
IC IALLUIS ; also invalidates the branch predictor
STR X9, [X1] ; create a new translation table entry with a new mapping
DSB ISH ; ensure completion of the I Cache & Branch Predictor invalidation
; AND ensure visibility of the new translation table mapping
ISB ; ensure synchronisation of this instruction stream
```

This example assumes the memory copies are performed by an observer that is coherent with the caches of PE P1. This observer might be P1 itself, using a specific paging mapping. For clarity, the example omits the functional descriptions of SaveMemoryPageToBackingStore and LoadMemoryFromBackingStore. LoadMemoryFromBackingStore is required to ensure that the memory updates that it makes are visible to instruction fetches.

In this example, the use of ICIALLUIS in AArch32 and IC IALLUIS in AArch64 to invalidate the entire instruction cache is a simplification, that might not be optimal for performance. An alternative approach involves invalidating all of the lines in the caches using ICIMV AU and IC IV AU operations in AArch32 and AArch64 respectively. This invalidation must be done when the mapping used for the ICIMVAU and IC IVAU operations is valid but not executable.

### F.5.4 Ordering of Memory-mapped device control with payloads

With a Memory-mapped peripheral, such as a DMA, which can also access memory for its own use, it is common to have control or status registers which are Memory-mapped. These registers need to be accessed in an ordered manner with respect to the data that the Memory-mapped peripheral is handling.

Two simple examples of this are:

- When a Processing Element is writing a buffer of data, and then writing to a control register in the DMA peripheral to start that peripheral to access the buffer of data.
- When a DMA peripheral has written to a buffer of data in memory, and the Processing Element is reading a status register to determine that the DMA transfer has completed, and then is reading the data.

For the case of the Processing Element writing a buffer of data, before starting the DMA peripheral, the ordering requirements between the stores to the data buffer and the stores to the Memory-mapped a to the DMA peripheral can be met by the insertion of a DSB <domain> instruction between these sets of accesses as this ensures the global observation of the stores before the DMA is started. This is shown by the following code:

#### AArch32

```
P1
STR R5, [R2] ; data written to the data buffer
DSB
STR R0, [R4] ; R4 contains the address of the DMA control register
```

#### AArch64

```
P1
STR W5, [X2] ; data written to the data buffer
```
DSB <domain>

STR W0, [X4]          ; X4 contains the address of the DMA control register

For the case of DMA peripheral writing the data buffer and then setting a status register when those stores are complete (and so globally observed) and then having this status register polled by the Processing element before the processing element reads the data buffer, the processing element must insert a DSB <domain> between the load that reads the status register, and the read of the buffer. A DMB, or load-acquire, is not sufficient as this problem is not solely concerned with observation order, since the polling read is actually a read of a status register at a slave, not the polling a data value that has been written by an observer.

For this case, the code is therefore:

**AArch32**

P1

WAIT ([R4] == 1)      ; R4 contains the address of the status register,
                     ; and the value ‘1’ indicates completion of the DMA transfer

DSB

LDR R5, [R2]          ; read data from the data buffer

**AArch64**

P1

WAIT ([X4] == 1)      ; X4 contains the address of the status register,
                     ; and the value ‘1’ indicates completion of the DMA transfer

DSB <domain>

LDR W5, [X2]          ; read data from the data buffer
F.6 ARMv7 compatible approaches for ordering, using DMB and DSB barriers

The following sections describe the ARMv7 compatible approaches for ordering, using DMB and DSB barriers:

- Simple ordering and barrier cases.
- Load-Exclusive, Store-Exclusive and barriers on page AppxF-4866.
- Using a mailbox to send an interrupt on page AppxF-4868.
- Cache and TLB maintenance operations and barriers on page AppxF-4868.

F.6.1 Simple ordering and barrier cases

ARM implements a weakly consistent memory model for Normal memory. In general terms, this means that the order of memory accesses observed by other observers might not be the order that appears in the program, for either loads or stores.

This section includes examples of this.

**Simple weakly consistent ordering example**

P1

```
STR R5, [R1]  
LDR R6, [R2]  
```

P2

```
STR R6, [R2]  
LDR R5, [R1]  
```

In the absence of barriers, the result of P1: R6=0, P2: R5=0 is permissible.

**Message passing**

The following sections describe:

- Weakly-ordered message passing problem
- Message passing with multiple observers on page AppxF-4861.

**Weakly-ordered message passing problem**

P1

```
STR R5, [R1] ; set new data  
STR R0, [R2] ; send flag indicating data ready  
```

P2

```
WAIT([R2]==1) ; wait on flag  
LDR R5, [R1] ; read new data  
```

In the absence of barriers, an end result of P2: R5=0 is permissible.

**Resolving by the addition of barriers**

The addition of barriers, to ensure the observed order of the reads and the writes, ensures that data is transferred so that the result P2:R5==0x55 is guaranteed, as follows:

P1

```
STR R5, [R1] ; set new data  
DMB [ST] ; ensure all observers observe data before the flag  
```
Appendix F Barrier Litmus Tests
F.6 ARMv7 compatible approaches for ordering, using DMB and DSB barriers

There is a rule within the ARM architecture that:

- Where the value returned by a read is used for computation of the virtual address of a subsequent read or write, then these two memory accesses are observed in program order.
- Where the value returned by a read is used for computation of the virtual address of a subsequent read or write, this is called an address dependency. An address dependency exists even if the value returned by the first read has no effect on the virtual address. This might occur if the value returned is masked off before it is used, or if it confirms a predicted address value that it might have changed.
- This restriction applies only when the data value returned by a read is used as a data value to calculate the address of a subsequent read or write. It does not apply if the data value returned by a read determines the condition flags values, and the values of the flags are used for condition code evaluation to determine the address of a subsequent read, either through conditional execution or the evaluation of a branch. This is called a control dependency.
- Where both a control and address dependency exist, the ordering behavior is consistent with the address dependency.

Table F-1 shows examples of address dependencies, control dependencies, and an address and control dependency.

<table>
<thead>
<tr>
<th>Address dependency</th>
<th>Control dependency</th>
<th>Address and control dependency^a</th>
</tr>
</thead>
<tbody>
<tr>
<td>(a)</td>
<td>(b)</td>
<td>(c)</td>
</tr>
<tr>
<td>LDR r1, [r0]</td>
<td>LDR r1, [r0]</td>
<td>LDR r1, [r0]</td>
</tr>
<tr>
<td>LDR r2, [r1]</td>
<td>AND r1, r1, #0</td>
<td>CMP r1, #55</td>
</tr>
<tr>
<td>LDR r2, [r3, r1]</td>
<td>LDRNE r2, [r3]</td>
<td>MOVNE r4, #22</td>
</tr>
</tbody>
</table>

^a. The address dependency takes priority.

This means that the data transfer example of Weakly-ordered message passing problem on page AppxF-4859 can also be satisfied as shown in the following example:

P1

STR R5, [R1] ; set new data
DMB [ST] ; ensure all observers observe data before the flag
STR R0, [R2] ; send flag indicating data ready

P2

WAIT([R2]=1)

AND R12, R12, #0 ; R12 is destination of LDR in WAIT macro
LDR R5, [R1, R12] ; Load is dependent and so is ordered after the flag has been seen
The load of R5 by P2 is ordered with respect to the load from [R2] because there is an address dependency using R12. P1 uses a DMB to ensure that P2 does not observe the write of [R2] before the write of [R1].

**Message passing with multiple observers**

Where the ordering of Normal memory accesses is not resolved by the use of barriers or dependencies, then different observers might observe the accesses in a different order, as shown in the following example:

P1

```
STR R5, [R1]             ; set new data
STR R0, [R2]             ; send flag indicating data ready
```

P2

```
WAIT([R2]==1)
AND R12, R12, #0         ; R12 is destination of LDR in WAIT macro
LDR R5, [R1, R12]        ; Load is dependent and so is ordered after the flag has been seen
```

P3

```
WAIT([R2]==1)
AND R12, R12, #0         ; R12 is destination of LDR in WAIT macro
LDR R5, [R1, R12]        ; Load is dependent and so is ordered after the flag has been seen
```

In this case, it is permissible for P2:R5 and P3:R5 to contain different values, because there is no order guaranteed between the two stores performed by P1.

**Resolving by the addition of barriers**

The addition of a barrier by P1, as shown in the following example, ensures the observed order of the writes, transferring data so that P2:R5 and P3:R5 both contain the value 0x55:

P1

```
STR R5, [R1]             ; set new data
DMB [ST]                 ; ensure all observers observe data before the flag
STR R0, [R2]             ; send flag indicating data ready
```

P2

```
WAIT([R2]==1)
AND R12, R12, #0         ; R12 is destination of LDR in WAIT macro
LDR R5, [R1, R12]        ; Load is dependent and so is ordered after the flag has been seen
```

P3

```
WAIT([R2]==1)
AND R12, R12, #0         ; R12 is destination of LDR in WAIT macro
LDR R5, [R1, R12]        ; Load is dependent and so is ordered after the flag has been seen
```

**Address dependency with object construction**

When accessing an object-oriented data structure, the address dependency rule means that barriers are not required, even when initializing the object:

P1

```
STR R5, [R1, #offset]    ; set new data in a field
```
Appendix F Barrier Litmus Tests
F.6 ARMv7 compatible approaches for ordering, using DMB and DSB barriers

DMB [ST] ; ensure all observers observe data before base address is updated
STR R1, [R2] ; update base address

P2
LDR R1, [R2] ; read for base address
CMP R1, #0 ; check if it is valid
BEQ null_trap
LDR R5, [R1, #offset] ; use base address to read field

If the null_trap is not taken, it is required that P2:R5==0x55. This avoids P2 observing a partially constructed object from P1. Significantly, P2 does not require a barrier to ensure this behavior.

P1 requires a barrier to ensure the observed order of the writes by P1. In general, the impact of requiring a barrier during the construction phase is much less than the impact of requiring a barrier for every read access.

Causal consistency issues with multiple observers

The fact that different observers can observe memory accesses in different orders extends, in the absence of barriers, to behaviors that do not fit naturally expected causal properties, as the following example shows:

P1
STR R0, [R2] ; set new data

P2
WAIT([R2]==1) ; wait to see new data from P1
STR R0, [R3] ; send flag, must be after the new data has been by P2 as stores
; must not be speculative

P3
WAIT([R3]==1) ; wait for P2's flag
AND R12, R12, #0 ; dependency to ensure order
LDR R0, [R2, R12] ; read P1's data

In this example, P3:R0==0 is permissible. P3 is not guaranteed to see the stores from P1 and P2 in any particular order. This applies despite the fact that the store from P2 can only happen after P2 has observed the store from P1.

This example shows that the ARM memory order model for Normal memory does not conform to causal consistency. This means that the apparently transitive causal relationship between two variables is not guaranteed to be transitive.

The following example shows the insertion of a barrier by P2 to create causal consistency:

P1
STR R0, [R2] ; set new data

P2
WAIT([R2]==1) ; wait to see new data from P1
DMB ; ensure P1's data is observed by all observers before any following store
STR R0, [R3] ; send flag

P3
WAIT([R3]==1) ; wait for P2's flag
AND R12, R12, #0 ; dependency to ensure order
LDR R0, [R2, R12] ; read P1's data

This creates causal consistency because a DMB is required to order all accesses that the executing PE observed before the DMB, not only those it issued, before any of the accesses that follow the DMB.

**Multiple observers of writes to multiple locations**

The ARM weakly consistent memory model means that different observers can observe writes to different locations in different orders, as the following example shows:

**P1**

```
STR R0, [R1] ; set new data
```

**P2**

```
STR R0, [R2] ; set new data
```

**P3**

```
LDR R10, [R2] ; read P2's data before P1's
LDR R9, [R1] ;
BIC R9, R10, R9 ; R9 <- R10 && ~R9
; R9 contains 1 iff read from [R2] is observed to be 1 and
; read from [R1] is observed to be 0.
```

**P4**

```
LDR R9, [R1]
LDR R10, [R2]
BIC R9, R9, R10 ; R9 <- R9 && ~R10
; R9 contains 1 iff read from [R2] is observed to be 0 and
; read from [R1] is observed to be 1.
```

In this example, the result P3:R9==1 and P4:R9==1 is permissible. This means that P3 and P4 observed the stores from P1 and P2 in different orders.

The following example shows the use of DMB instructions to ensure sequential consistency:

**P1**

```
STR R0, [R1] ; set new data
```

**P2**

```
STR R0, [R2] ; set new data
```

**P3**

```
LDR R10, [R2] ; read P2's data before P1's
DMB
LDR R9, [R1]
BIC R9, R10, R9 ; R9 <- R10 && ~R9
; R9 contains 1 iff read from [R2] is observed to be 1 and
; read from [R1] is observed to be 0.
```

**P4**

```
LDR R9, [R1] ; read P1's data before P2's
```
F.6 ARMv7 compatible approaches for ordering, using DMB and DSB barriers

DMB

```
LDR R10, [R2]
BIC R9, R9, R10          ; R9 <- R9 & ~R10
                         ; R9 contains 1 iff read from [R2] is observed to be 0 and
                         ; read from [R1] is observed to be 1.
```

In this example:

• the DMB executed by P3 ensures that, if the P3 load from [R2] observes the P2 store to [R2], then all observers observe the P2 store to [R2] before they observe the P3 load from [R1]

• the DMB executed by P4 ensures that, if the P4 load from [R1] observes the P1 store to [R1], then all observers observe the P1 store to [R1] before they observe the P4 load from [R2].

If the P3 load from [R1] returns 0, then it has not observed the P1 store to [R1]. Also, if the P3 load of [R2] returns 1, then all observers must have observed the P2 store to [R2] before they observed the P1 store to [R1]. This means that P4 cannot observe the P1 store to [R1] without also observing the P2 store to [R2].

Alternatively, if the P4 load from [R2] returns 0, then it has not observed the P2 store to [R2]. If, also, the P4 load of [R1] returns 1, then all observers must have observed the P1 store to [R1] before they observed the P2 store to [R2]. This means that P3 cannot observe the P2 store to [R2] without also observing the P1 store to [R1].

This shows that, of the four possible results for {P3:R9, P4:R9}, the insertion of these barriers makes the result {1, 1} impossible.

Posting a store before polling for acknowledgement

In the case where an observer stores to a location, and then polls for an acknowledge from a different observer, the weak ordering of the memory model can lead to a deadlock, as the following example shows:

P1

```
STR R0, [R2]
WAIT ([R3]==1)
```

P2

```
WAIT ([R2]==1)
STR R0, [R3]
```

In ARMv7 implements that do not include the Multiprocessing Extensions, then this can deadlock because P2 might not observe the store by P1 in finite time. For ARMv7 implementations with the Multiprocessing Extensions and for ARMv8, this is not an issue as all stores must be observed by all observers within their shareability domain in finite time.

The addition of a DMB instruction prevents this deadlock in ARMv7 implementations that do not include the Multiprocessing Extensions:

P1

```
STR R0, [R2]
DMB
WAIT ([R3]==1)
```

P2

```
WAIT ([R2]==1)
STR R0, [R3]
```
Appendix F Barrier Litmus Tests

F.6 ARMv7 compatible approaches for ordering, using DMB and DSB barriers

The DMB executed by P1 ensures that P2 observes the store by P1 before it observes the load by P1. This ensures a timely completion.

The following example is a variant of the previous example, where the two observers poll the same memory location:

P1

```
STR R0, [R2]
WAIT ([R2]==2)
```

P2

```
WAIT ([R2]==1)
LDR R0, [R2]
ADD R0, R0, #1
```

```
STR R0, [R2]
```

In this example, the same deadlock can occur, because the architecture permits P1 to read the result of its own store to [R2] early, and continue doing so for an indefinite amount of time. The addition of a DMB instruction prevents this deadlock:

P1

```
STR R0, [R2]
DMB
WAIT ([R2]==2)
```

P2

```
WAIT ([R2]==1)
LDR R0, [R2]
ADD R0, R0, #1
```

```
STR R0, [R2]
```

**WFE and WFI and barriers**

The Wait For Event and Wait For Interrupt instructions permit the PE to suspend execution and enter a low-power state. A DSB barrier instruction is required if it is necessary to ensure that memory accesses made before the WFI or WFE are visible to other observers, unless some other mechanism has ensured this visibility. Examples of other mechanism that would guarantee the required visibility are the DMB described in *Posting a store before polling for acknowledgement* on page AppxF-4864, or a dependency on a load.

The following example requires the DSB to ensure that the store is visible:

P1

```
STR R0, [R2]
DSB
```

```
Loop
WFI
B Loop
```

However, if the example in *Posting a store before polling for acknowledgement* on page AppxF-4864 is extended to include a WFE, there is no risk of a deadlock. The extended example is:

P1

```
STR R0, [R2]
```

```
DSB
```

```
Loop
WFI
B Loop
```
Appendix F Barrier Litmus Tests

F.6 ARMv7 compatible approaches for ordering, using DMB and DSB barriers

F.6.2 Load-Exclusive, Store-Exclusive and barriers

The Load-Exclusive and Store-Exclusive instructions, described in Synchronization and semaphores on page B2-100, are predictable only with Normal memory. These instructions do not have any implicit barrier functionality. Therefore, any use of these instructions to implement locks of any type requires the addition of explicit barriers.

**Acquiring a lock**

A common use of Load-Exclusive and Store-Exclusive instructions is to claim a lock to permit entry into a critical region. This is typically performed by testing a lock variable that indicates 0 for a free lock and some other value, commonly 1 or an identifier of the process holding the lock.

The lack of implicit barriers in the Load-Exclusive and Store-Exclusive instructions means that the mechanism requires a DMB instruction between acquiring a lock and making the first access to the critical region, to ensure that all observers observe the successful claim of the lock before they observe any subsequent loads or stores to the region. This example shows Px acquiring a lock:

```assembly
P_x
Loop
LDREX R5, [R1] ; read lock
CMP R5, #0 ; check if 0
STREXEQ R5, R0, [R1] ; attempt to store new value
CMPEQ R5, #0 ; test if store succeeded
BNE Loop ; retry if not
DMB ; ensures that all subsequent accesses are observed after the
; gaining of the lock is observed
```

In this example:

- the DMB by P1 ensures that P2 observes the store by P1 before it observes the load by P1
- the dependency of the WFE on the result of the load by P1 means that this load must complete before P1 executes the WFE.

For more information about SEV, see Use of Wait For Event (WFE) and Send Event (SEV) with locks on page AppxF-4867.
Appendix F Barrier Litmus Tests
F.6 ARMv7 compatible approaches for ordering, using DMB and DSB barriers

Releasing a lock
The converse operation of releasing a lock does not require the use of Load-Exclusive and Store-Exclusive instructions, because only a single observer is able to write to the lock. However, often it is necessary for any observer to observe any memory updates, or any values that are loaded into memory, before they observe the release of the lock. Therefore, a DMB usually precedes the lock release, as the following example shows.

```
Px
; loads and stores in the critical region
MOV R0, #0
DMB                      ; ensure all previous accesses are observed before the lock is cleared
STR R0, [R1]             ; clear the lock
```

Use of Wait For Event (WFE) and Send Event (SEV) with locks
The ARMv8 architecture includes Wait For Event and Send Event instructions, that can be executed to reduce the required number of iterations of a lock-acquire loop, or spinlock, to reduce power. The basic mechanism involves an observer that is in a spinlock executing a WFE instruction that suspends execution on that observer until an asynchronous exception or an explicit event, sent by some other observer using the SEV instruction, is seen by the suspended observer. An observer that holds the lock executes an SEV instruction to send an event after it has released the lock.

The Event signal is a non-memory communication, and therefore the memory update that releases the lock must be observable by all observers before the SEV instruction is executed and the event is sent. This requires the use of DSB instruction, rather than DMB.

Therefore, the following is an example of lock acquire code using WFE:

```
Px
Loop
LDREX R5, [R1]           ; read lock
CMP R5, #0               ; check if 0
WFENE                    ; sleep if the lock is held
STREXEQ R5, R0, [R1]     ; attempt to store new value
CMPEQ R5, #0             ; test if store succeeded
BNE Loop                 ; retry if not
DMB                      ; ensures that all subsequent accesses are observed after the
; gaining of the lock is observed
; loads and stores in the critical region can now be performed
```

And the following is an example of lock release code using SEV:

```
Px
; loads and stores in the critical region
MOV R0, #0
DMB                      ; ensure all previous accesses are observed before the lock is cleared
STR R0, [R1]             ; clear the lock
DSB                      ; ensure completion of the store that cleared the lock before
```
F.6 ARMv7 compatible approaches for ordering, using DMB and DSB barriers

F.6.3 Using a mailbox to send an interrupt

In some message passing systems, it is common for one observer to update memory and then notify a second observer of the update by sending an interrupt, using a mailbox.

Although a memory access might be made to initiate the sending of the mailbox interrupt, a DSB instruction is required to ensure the completion of previous memory accesses.

Therefore, the following sequence is required to ensure that P2 observes the updated value:

P1

```
STR R5, [R1]             ; message stored to shared memory location
DSB [ST]
STR R1, [R4]             ; R4 contains the address of a mailbox
```

P2

```
; interrupt service routine
LDR R5, [R1]
```

Note

The DSB executed by P1 ensures global observation of the store to [R1]. The interrupt timing ensures that the code executed by P2 is executed after the global observation of the update to [R1], and therefore must see this update. In some implementations, this might be implemented by requiring that interrupts flush non-coherent buffers that hold speculatively loaded data.

F.6.4 Cache and TLB maintenance operations and barriers

The following sections describe the use of barriers with cache and TLB maintenance operations:

- Data cache maintenance operations
- Instruction cache maintenance operations on page AppxF-4871
- TLB maintenance operations and barriers on page AppxF-4873.

Data cache maintenance operations

The following sections describe the use of barriers with data cache maintenance operations:

- Message passing to non-caching observers
- Multiprocessing message passing to non-caching observers on page AppxF-4869
- Invalidating DMA buffers, non-functional example on page AppxF-4869
- Invalidating DMA buffers, functional example with single PE on page AppxF-4870
- Invalidating DMA buffers, functional example with multiple coherent PEs on page AppxF-4870.

Message passing to non-caching observers

The ARMv8 architecture requires the use of DMB instructions to ensure the ordering of data cache maintenance operations and their effects. This means the following message passing approaches can be used when communicating between caching observers and non-caching observers:

P1

```
STR R5, [R1]             ; update data (assumed to be in P1’s cache)
DCCMVAC R1               ; clean cache to point of coherency
```
Appendix F Barrier Litmus Tests
F.6 ARMv7 compatible approaches for ordering, using DMB and DSB barriers

```
DMB ; ensure effects of the clean will be observed before the flag is set
STR R0, [R4] ; send flag to external agent (Non-cacheable location)

E1

WAIT ([R4] == 1) ; wait for the flag
DMB ; ensure that flag has been seen before reading data
LDR R5, [R1] ; read the data
```

In this example, it is required that E1:R5==0x55.

**Multiprocessing message passing to non-caching observers**

The broadcast nature of the cache maintenance operations in ARMv8, and in ARMv7 implementations that include the Multiprocessing Extensions, combined with properties of barriers, means that the message passing principle for non-caching observers is:

```
P1

STR R5, [R1] ; update data (assumed to be in P1's cache)
DMB [ST] ; ensure new data is observed before the flag to P2 is set
STR R0, [R2] ; send flag to P2

P2

WAIT ([R2] == 1) ; wait for flag from P1
DMB ; ensure cache clean is observed after P1's flag is observed
DCOMVAC R1 ; clean cache to point of coherency - this cleans the cache of P1
DMB ; ensure effects of the clean are observed before the flag to E1 is set
STR R0, [R4] ; send flag to E1

E1

WAIT ([R4] == 1) ; wait for flag from P2
DMB ; ensure that flag has been observed before reading the data
LDR R5, [R1] ; read the data
```

In this example, it is required that E1:R5==0x55. The clean operation executed by P2 affects the data location in the P1 cache. The cast-out from the P1 cache is guaranteed to be observed before P2 updates [R4].

**Invalidating DMA buffers, non-functional example**

The basic scheme for communicating with an external observer that is a process that passes data in to a Cacheable memory region must take account of the architectural requirement that regions marked as Cacheable can be allocated into a cache at any time, for example as a result of speculation. The following example shows this possibility:

```
P1

DCIMVAC R1 ; ensure cache clean with respect to memory. A clean operation could be
; used but the DMA overwrites this region so an invalidate operation
; is sufficient and usually more efficient
DMB ; ensures cache invalidation is observed before the next store is observed
STR R0, [R3] ; send flag to external agent
WAIT ([R4]==1) ; wait for a different flag from an external agent
```
Appendix F Barrier Litmus Tests
F.6 ARMv7 compatible approaches for ordering, using DMB and DSB barriers

DMB                      ; observe flag from external agent before reading new data. However [R1]
                         ; could have been brought into cache earlier
LDR R5, [R1]
E1
WAIT ([R3] == 1)         ; wait for flag
STR R5, [R1]             ; store new data
DMB
STR R0, [R4]             ; send a flag

If a speculative access occurs, there is no guarantee that the cache line containing [R1] is not brought back into the
cache after the cache invalidation, but before [R1] is written by E1. Therefore, the result P1:R5=0 is permissible.

Invalidating DMA buffers, functional example with single PE

P1
DCIMVAC R1               ; ensure cache clean with respect to memory. A clean operation could be
                         ; used but the DMA overwrites this region so an invalidate operation
                         ; is sufficient and usually more efficient
DMB                      ; ensures cache invalidation is observed before the next store is observed
STR R0, [R3]             ; send flag to external agent
WAIT ([R4]=1)            ; wait for a different flag from an external agent
DMB                      ; ensure that cache invalidate is observed after the flag
                         ; from external agent is observed
DCIMVAC R1               ; ensure cache discards stale copies before use
LDR R5, [R1]
E1
WAIT ([R3] == 1)         ; wait for flag
STR R5, [R1]             ; store new data
DMB [ST]
STR R0, [R4]             ; send a flag

In this example, the result P1:R5 == 0x55 is required. Including a cache invalidation after the store by E1 to [R1] is
observed ensures that the line is fetched from external memory after it has been updated.

Invalidating DMA buffers, functional example with multiple coherent PEs

The broadcasting of cache maintenance operations, and the use of DMB instructions to ensure their observability,
means that the previous example extends naturally to a multiprocessor system. Typically this requires a transfer of
ownership of the region that the external observer is updating.

P0
(Use data from [R1], potentially using [R1] as scratch space)
DMB
STR R0, [R2]             ; signal release of [R1]
WAIT ([R2] == 0)         ; wait for new value from DMA
F.6 ARMv7 compatible approaches for ordering, using DMB and DSB barriers

### Instruction cache maintenance operations

The following sections describe the use of barriers with instruction cache maintenance operations:

- **Ensuring the visibility of updates to instructions for a uniprocessor**
- **Ensuring the visibility of updates to instructions for a multiprocessor** on page AppxF-4872.

#### Ensuring the visibility of updates to instructions for a uniprocessor

On a single PE, the agent that causes instruction fetches, or instruction cache linefills, is a separate memory system observer from the agent that causes data accesses. Therefore, any operations to invalidate the instruction cache can rely only on seeing updates to memory that are complete. This must be ensured by the use of a `DSB` instruction.

Also, instruction cache maintenance operations are only guaranteed to complete after the execution of a `ISB`, and an `ISB` is required to discard any instructions that might have been prefetched before the instruction cache invalidation completed. Therefore, on a uniprocessor, to ensure the visibility of an update to code and to branch to it, the following sequence is required:

```
P1
  STR R11, [R1] ; R11 contains a new instruction to store in program memory
  DCOMVAU R1 ; clean to PoU makes visible to instruction cache
  DSB
  ICIMVAU R1 ; ensure instruction cache and branch predictor discards stale data
  BPDMVA R1
```

In this example, the result P0:R5 == 0x55 is required. The `DMB` issued by P1 after the first data cache invalidation ensures that effect of the cache invalidation on P0 is seen by E1 before the store by E1 to [R1]. The `DMB` issued by P1 after the second data cache invalidation ensures that its effects are seen before the store of 0 to the semaphore location in [R2].
Ensuring the visibility of updates to instructions for a multiprocessor

ARMv8, and an ARMv7 implementation that includes the Multiprocessing Extensions, requires a PE that performs an instruction cache maintenance operation to execute a DSB instruction to ensure completion of the maintenance operation. This ensures that the cache maintenance operation is complete on all PEs in the Inner Shareable shareability domain.

An ISB is not broadcast, and so does not affect other PEs. This means that any other PE must perform its own ISB synchronization after it knows that the update is visible, if it is necessary to ensure its synchronization with the update. The following example shows how this might be done:

P1

```
STR R11, [R1]            ; R11 contains a new instruction to store in program memory
DCCMVAU R1               ; clean to PoU makes visible to instruction cache
DSB                      ; ensure completion of the clean on all processors
ICIMVAU R1               ; ensure instruction cache/branch predictor discards stale data
BPIMVA R1
DSB                      ; ensure completion of the ICache and branch predictor
; invalidation on all processors
STR R0, [R2]             ; set flag to signal completion
ISB                      ; synchronize context on this processor
BX R1                    ; branch to new code
```

P2-Px

```
WAIT ([R2] == 1)         ; wait for flag signaling completion
ISB                      ; synchronize context on this processor
BX R1                    ; branch to new code
```

Nonfunctional approach

The following sequence does not have the same effect, because a DSB is not required to complete the instruction cache maintenance operations that other PEs issue:

P1

```
STR R11, [R1]            ; R11 contains a new instruction to store in program memory
DCCMVAU R1               ; clean to PoU makes visible to instruction cache
DSB                      ; ensure completion of the clean on all processors
ICIMVAU R1               ; ensure instruction cache/branch predictor discards stale data
BPIMVA R1
DMB                      ; ensure ordering of the store after the invalidation
; DOES NOT guarantee completion of instruction cache/branch
; predictor on other processors
STR R0, [R2]             ; set flag to signal completion
```
F.6 ARMv7 compatible approaches for ordering, using DMB and DSB barriers

DSB ; ensure completion of the invalidation on all processors
ISB ; synchronize context on this processor
BX R1 ; branch to new code

P2-Px

WAIT ([R2] == 1) ; wait for flag signaling completion
DSB ; this DSB does not guarantee completion of P1’s ICIMVAU/BPIMVA
ISB
BX R1

In this example, P2…Px might not see the updated region of code at R1.

TLB maintenance operations and barriers

The following sections describe the use of barriers with TLB maintenance operations:

- Ensuring the visibility of updates to translation tables for a uniprocessor
- Ensuring the visibility of updates to translation tables for a multiprocessor on page AppxF-4874
- Paging memory in and out on page AppxF-4874.

Ensuring the visibility of updates to translation tables for a uniprocessor

On a single PE, the agent that causes translation table walks is a separate memory system observer from the agent that causes data accesses. Therefore, any operations to invalidate the TLB can only rely on seeing updates to memory that are complete. This must be ensured by the use of a DSB instruction.

In the ARMv8 architecture, and in an ARMv7 implementation that includes the Multiprocessing Extensions, translation table walks must look in the data or unified caches at L1, so such systems do not require data cache cleaning.

After the translation tables update, any old copies of entries that might be held in the TLBs must be invalidated. This operation is only guaranteed to affect all instructions, including instruction fetches and data accesses, after the execution of a DSB and an ISB. Therefore, the code for updating a translation table entry is:

P1

STR R11, [R1] ; update the translation table entry
DSB ; ensure visibility of the update to translation table walks
TLBIMVA R10
BPIALL
DSB ; ensure completion of the BP and TLB invalidation
ISB ; synchronize context on this processor
;
; new translation table entry can be relied upon at this point and all accesses
; generated by this observer using the old mapping have been completed

Importantly, by the end of this sequence, all accesses that used the old translation table mappings have been observed by all observers.

An example of this is where a translation table entry is marked as invalid. Such a system must provide a mechanism to ensure that any access to a region of memory being marked as invalid has completed before any action is taken as a result of the region being marked as invalid.
Ensuring the visibility of updates to translation tables for a multiprocessor

The same code sequence can be used in a multiprocessing system. In the ARMv8 architecture, and in an ARMv7 implementation that includes the Multiprocessing Extensions, a PE that performs a TLB maintenance operation must execute a DSB instruction to ensure completion of the maintenance operation. This ensures that the TLB maintenance operation is complete on all PEs in the Inner Shareable shareability domain.

The completion of a DSB that completes a TLB maintenance operation ensures that all accesses that used the old mapping have completed.

P1

```
STR R11, [R1]            ; update the translation table entry
DSB                      ; ensure visibility of the update to translation table walks
TLBIMVAIS R10
BPIALLIS
DSB                      ; ensure completion of the BP and TLB invalidation
ISB                      ; Note ISB is not broadcast and must be executed locally on other processors

; new translation table entry can be relied upon at this point and all accesses generated by any
; observers affected by the broadcast TLBIMVAIS operation using the old mapping have completed
```

The completion of the TLB maintenance operation is guaranteed only by the execution of a DSB by the observer that performed the TLB maintenance operation. The execution of a DSB by a different observer does not have this effect, even if the DSB is known to be executed after the TLB maintenance operation is observed by that different observer.

Paging memory in and out

In a multiprocessor system there is a requirement to ensure the visibility of translation table updates when paging regions of memory into RAM from a backing store. This might, or might not, also involve paging existing locations in memory from RAM to a backing store. In such situations, the operating system selects one or more pages of memory that might be in use but are suitable to discard, with or without copying to a backing store, depending on whether or not the region of memory is writable. Disabling the translation table mappings for a page, and ensuring the visibility of that update to the translation tables, prevents agents accessing the page.

For this reason, it is important that the DSB that is performed after the TLB invalidation ensures that no other updates to memory using those mappings are possible.

An example sequence for the paging out of an updated region of memory, and the subsequent paging in of memory, is as follows:

P1

```
STR R11, [R1]            ; update the translation table for the region being paged out
DSB                      ; ensure visibility of the update to translation table walks
TLBIMVAIS R10            ; invalidate the old entry
DSB                      ; ensure completion of the invalidation on all processors
ISB                      ; ensure visibility of the invalidation
BL SaveMemoryPageToBackingStore
BL LoadMemoryFromBackingStore
DSB                      ; ensure completion of the memory transfer (this could be part of
; LoadMemoryFromBackingStore
ICIALLUIS                ; also invalidates the branch predictor
```
STR R9, [R1]  ; create a new translation table entry with a new mapping
DSB  ; ensure completion of instruction cache and branch predictor invalidation
        ; and ensure visibility of the new translation table mapping
ISB  ; ensure synchronization of this instruction stream

This example assumes the memory copies are performed by an observer that is coherent with the caches of PE P1. This observer might be P1 itself, using a specific paging mapping. For clarity, the example omits the functional descriptions of SaveMemoryPageToBackingStore and LoadMemoryFromBackingStore. LoadMemoryFromBackingStore is required to ensure that the memory updates that it makes are visible to instruction fetches.

In this example, the use of ICIALLUIS to invalidate the entire instruction cache is a simplification, that might not be optimal for performance. An alternative approach involves invalidating all of the lines in the caches using ICIMVAU operations. This invalidation must be done when the mapping used for the ICIMVAU operations is valid but not executable.

Appendix G
ARMv8 Pseudocode Library

This appendix contains the ARMv8 pseudocode library. It contains the following sections:

• Library pseudocode for AArch64 on page AppxG-4878.
• Library pseudocode for AArch32 on page AppxG-4927.
• Common library pseudocode on page AppxG-4986.

__________ Note ____________

Status of this appendix in the beta release document

ARM is currently working to improve the organization and presentation of the pseudocode in this document, including providing improved linking within the pseudocode. Currently, this chapter contains the complete pseudocode library for ARMv8, split between:

• Functions, or versions of functions, that are specific to execution in AArch64 state.
• Functions, or versions of functions, that are specific to execution in AArch32 state.
• Functions that apply to execution in either Execution state.

Many pseudocode functions are included elsewhere in the document, to accompany the description of the associated functionality. Currently, those functions are repeated in this appendix.
G.1 Library pseudocode for AArch64

This section holds the pseudocode for execution in AArch64 state. Functions listed in this section are identified as AArch64.FunctionName. Some of these functions have an equivalent AArch32 function, AArch32.FunctionName. This section is organized by functional groups, with the functional groups being indicated by hierarchical path names, for example aarch64/debug/breakpoint.

G.1.1 aarch64/debug

This section contains the pseudocode for AArch64 state that relates to debug.

aarch64/debug/breakpoint

// Breakpoints in an AArch64 translation regime
// AArch64.BreakpointValueMatch()  
// ==============================  
boolean AArch64.BreakpointValueMatch(integer n, bits(64) vaddress, boolean linked_to)

    // "n" is the identity of the breakpoint unit to match against
    // "vaddress" is the current instruction address, ignored if linked_to is TRUE and Context
    // matching breakpoints.
    // "link_to" is TRUE if this is a call from StateMatch for linking.

    // If a non-existant breakpoint then it is CONSTRAINED UNPREDICTABLE whether this gives
    // no match or the breakpoint is mapped to another UNKNOWN implemented breakpoint.
    if n > UInt(ID_AA64DFR0_EL1.BRPs) then
        (c, n) = ConstrainUnpredictableInteger(0, UInt(ID_AA64DFR0_EL1.BRPs));
        assert c IN {Constraint_NONE, Constraint_UNKNOWN};
        if c == Constraint_NONE then return FALSE;

    // If this breakpoint is not enabled, it cannot generate a match. (This could also happen on a
    // call from StateMatch for linking.)
    if DBGBCR_EL1[n].E == '0' then return FALSE;

    // Return FALSE if BT is set to a reserved type.
    if DBGBCR_EL1[n].BT IN {'011x','11xx'} then return FALSE;

    // Determine what to compare against.
    match_addr = DBGBCR_EL1[n].BT<3,1> == '00';
    match_vmid = DBGBCR_EL1[n].BT<3> == '1';
    match_cid  = DBGBCR_EL1[n].BT<1> == '1';
    linked     = DBGBCR_EL1[n].BT<0> == '1';

    // Assertions based on the definition of DBGBCR_EL1[n].BT.
    // Unless this breakpoint is context-aware, BT<3,1> are RAZ, and
    // doesn't match VMID or CONTEXTIDR
    assert (n >= UInt(ID_AA64DFR0_EL1.BRPs) - UInt(ID_AA64DFR0_EL1.CTX_CMPs) ||
        (IsZero(DBGBCR_EL1[n].BT<3,1>) && !match_vmid && !match_cid));

    // Must be matching either address, or one or both of CONTEXTIDR and VMID. This assertion is
    // obviously true given the definition of these variables.
    assert ((match_addr && !match_cid && !match_vmid) ||
        (!match_addr && match_cid) || (!match_addr && match_vmid));

    // VMID matching is not possible/allowable if no EL2 support.
    assert HaveEL(EL2) || !match_vmid;

    // If this is a call from StateMatch, return FALSE if the breakpoint is not programmed for a
    // VMID and/or context ID match, of if not context-aware. The above assertions mean that the
    // code can just test for match_addr == TRUE to confirm all these things.
    if linked_to && (!linked || match_addr) then return FALSE;

    // If this is a call from BreakpointMatch return FALSE for Linked context ID and/or
    // VMID matches.
    if !linked_to && linked && !match_addr then return FALSE;

G.2 Library pseudocode for AArch32

This section holds the pseudocode for execution in AArch32 state. Functions listed in this section are identified as `AArch32.FunctionName`. Some of these functions have an equivalent AArch64 function, `AArch64.FunctionName`. This section is organized by functional groups, with the functional groups being indicated by hierarchical path names, for example `aarch32/debug/breakpoint`.

G.2.1 aarch32/debug

This section contains the pseudocode for AArch32 state that relates to debug.

G.3 Common library pseudocode

This section holds the pseudocode that is common to execution in AArch64 state and in AArch32 state. Functions listed in this section are identified only by a FunctionName, without an AArch64. or AArch32. prefix. This section is organized by functional groups, with the functional groups being indicated by hierarchical path names, for example shared/debug/DebugTarget.

G.3.1 shared/debug

This section contains the pseudocode that relates to debug and is common to AArch32 state and AArch64 state.

shared/debug/CONTEXTIDR_GEN

```
// CONTEXTIDR_GEN()
// ================
bits(32) CONTEXTIDR_GEN[]
// AArch32 CONTEXTIDR is Banked, but there is no banking in AArch64.
return (if ELUsingAArch32(EL3) && IsSecure() then CONTEXTIDR_S else CONTEXTIDR_EL1);
```

shared/debug/ClearStickyErrors

```
// ClearStickyErrors()
// =============
ClearStickyErrors()
EDSCR.TXU = '0';          // Clear TX underrun flag
EDSCR.RXO = '0';          // Clear RX overrun flag
if Halted() then          // in Debug state
  EDSR.ITO = '0';         // Clear ITR overrun flag
EDSCR.ERR = '0';          // Clear cumulative error flag
return;
```

shared/debug/DebugTarget

```
// DebugTargetFrom()
// ============
bits(2) DebugTargetFrom(boolean secure)
// Returns the debug exception target EL
route_to_el2 = HaveEL(EL2) && !secure && (MDCR_EL2.TDE == '1' || HCR_EL2.TGE == '1');
if route_to_el2 then
  target = EL2;

G.3.2 shared/exceptions

This section contains the pseudocode that relates to exception handling and is common to AArch32 state and
AArch64 state.

shared/exceptions

// ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
// Shared Exception Model
// ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

// Typical flow through a translation for EL0 using AArch32 under EL1 using AArch64
// is as follows:
//    WFE instruction pseudocode (AArch32)
//         |-> AArch32.WFxTrap(EL2)
//         |-> AArch32.TakeHypTrapException()
//         |-> AArch32.EnterHypMode()
//         |-> AArch32.BranchTo(HVBAR + offset)
// However, as necessary the exception handlers are marshalled to the correct
// exception regime for the exception type:
//
// WFE instruction pseudocode (AArch32)
//   |-> AArch32.WFxTrap(EL2)
//     |-> AArch64.WFxTrap(EL2)
//     |-> AArch64.TakeException(EL2)
//     |-> MaybeZeroRegisterUppers()
//     |-> AArch64.ReportException()
//     |-> AArch64.BranchTo(VBAR[EL2] + offset)
//
// Syndrome handling is different in the two worlds, and this is deliberate (though
// not necessarily fortunate). AArch64 passes the syndrome down to the exception
// entry which writes ESR and FAR; AArch32 does this for Hyp entries but otherwise
// writes these before calling the entry point. This is necessary in the AArch32
// case because of the variance due to descriptor format, eventual destination of
// the exception, etc.

// Exception

shared/translation/translation

// ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
// Shared Translation System
// ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
// Shared exception model and translation table walking code.
// ~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
// Typical flow through a translation for EL0 using AArch32 under EL1 using AArch64
// is as follows:
// AArch32.TranslateAddress(bits(32) vaddress)
// |    -> AArch64.TranslateAddress(ZeroExtend(vaddress, 64))
// |         |    -> AArch64.FirstStageTranslate(vaddress)
// |         |         |    -> AArch64.TranslationTableWalkLD()
// |         |         |    -> AArch64.SecondStageWalk()
// |         |         |         |    -> AArch64.SecondStageTranslate()
// |         |         |         |         |    -> AArch64.TranslationTableWalkLD()
// |         |         |    -> AArch64.SecondStageTranslate(vaddress)
// |         |         |         |    -> AArch64.TranslationTableWalkLD()
// |         |    -> AArch64.TranslationTableWalkLD()
// In ARMv7 "SecondStageTranslate" was used only for the recursive call from
// TranslationTableWalkLD. For ARMv8 it is extended to deal with all
// second stage translations, so as to support EL0 and EL1 using AArch32
// under EL2 using AArch64:
// AArch32.TranslateAddress(bits(32) vaddress)
// |    -> AArch32.FirstStageTranslate(vaddress)
// |         |    -> AArch32.TranslationTableWalkLD()
// |         |    -> AArch32.SecondStageWalk()
// |         |    -> AArch32.SecondStageTranslate()
// |         |         |    -> AArch64.SecondStageTranslate()
// |         |         |         |    -> AArch64.TranslationTableWalkLD()
// |    -> AArch32.SecondStageTranslate(vaddress)
// |         |    -> AArch64.SecondStageTranslate(vaddress)
// |         |         |    -> AArch64.TranslationTableWalkLD()
// Should translation fail then it calls DataAbort, but importantly it stays in
// the right translation regime so calls the correct exception handler.

Appendix G ARMv8 Pseudocode Library
G.3 Common library pseudocode
Appendix H
ARM Pseudocode Definition

This appendix provides a definition of the pseudocode used in this manual, and defines some helper procedures and functions used by pseudocode. It contains the following sections:

- About the ARM pseudocode on page AppxH-5060.
- Pseudocode for instruction descriptions on page AppxH-5061.
- Data types on page AppxH-5063.
- Expressions on page AppxH-5067.
- Operators and built-in functions on page AppxH-5069.
- Statements and program structure on page AppxH-5074.
- Miscellaneous helper procedures and functions on page AppxH-5078.

**********

Note

Status of this appendix in the beta release document

ARM is currently working to improve the organization and presentation of the pseudocode in this document. Currently, this chapter contains the ARMv7 definition, and needs updating to incorporate changes and extensions to the pseudocode made for ARMv8. These updates will appear in the next issue of this manual.

The pseudocode in this manual describes ARMv8 execution in both AArch32 state and AArch64 state. It does not describe differences in earlier versions of the architecture.
H.1 About the ARM pseudocode

See the Note on the front page of this appendix, Status of this appendix in the beta release document on page AppxH-5059.

The ARM pseudocode provides precise descriptions of some areas of the ARM architecture. This includes description of the decoding and operation of all valid instructions. Pseudocode for instruction descriptions on page AppxH-5061 gives general information about this instruction pseudocode, including its limitations.

The following sections describe the ARM pseudocode in detail:
• Data types on page AppxH-5063.
• Expressions on page AppxH-5067.
• Operators and built-in functions on page AppxH-5069.
• Statements and program structure on page AppxH-5074.

Miscellaneous helper procedures and functions on page AppxH-5078 describes some pseudocode helper functions, that are used by the pseudocode functions that are described elsewhere in this manual. Appendix I contains the indexes to the pseudocode.

H.1.1 General limitations of ARM pseudocode

The pseudocode statements IMPLEMENTATION_DEFINED, SEE, SUBARCHITECTURE_DEFINED, UNDEFINED, and UNPREDICTABLE indicate behavior that differs from that indicated by the pseudocode being executed. If one of them is encountered:
• Earlier behavior indicated by the pseudocode is only specified as occurring to the extent required to determine that the statement is executed.
• No subsequent behavior indicated by the pseudocode occurs. This means that these statements terminate pseudocode execution.

For more information, see Simple statements on page AppxH-5074.
H.2 Pseudocode for instruction descriptions

Each instruction description includes pseudocode that provides a precise description of what the instruction does, subject to the limitations described in General limitations of ARM pseudocode on page AppxH-5060 and Limitations of the instruction pseudocode on page AppxH-5062.

In the instruction pseudocode, instruction fields are referred to by the names shown in the encoding diagram for the instruction. Instruction encoding diagrams and instruction pseudocode gives more information about the pseudocode provided for each instruction.

H.2.1 Instruction encoding diagrams and instruction pseudocode

Note

Currently this appendix only describes A32/T32 instruction pseudocode. This information is only partially applicable to the A64 instruction descriptions. This will be corrected in the next issue of the document.

Instruction descriptions in this manual contain:

- An Encoding section, containing one or more encoding diagrams, each followed by some encoding-specific pseudocode that translates the fields of the encoding into inputs for the common pseudocode of the instruction, and picks out any encoding-specific special cases.

- An Operation section, containing common pseudocode that applies to all of the encodings being described. The Operation section pseudocode contains a call to the EncodingSpecificOperations() function, either at its start or only after a condition code check performed by if ConditionPassed() then.

An encoding diagram specifies each bit of the instruction as one of the following:

- An obligatory 0 or 1, represented in the diagram as 0 or 1. If this bit does not have this value, the encoding corresponds to a different instruction.

- A should be 0 or 1, represented in the diagram as (0) or (1). If this bit does not have this value, the instruction is UNPREDICTABLE. For more information, see SBZ or SBO fields in instructions on page AppxA-4760.

- A named single bit or a bit in a named multi-bit field. The cond field in bits[31:28] of many A32/T32 instructions has some special rules associated with it.

An encoding diagram matches an instruction if all obligatory bits are identical in the encoding diagram and the instruction, and one of the following is true:

- The encoding diagram is not for an A32/T32 instruction.

- The encoding diagram is for an A32/T32 instruction that does not have a cond field in bits[31:28].

- The encoding diagram is for an A32/T32 instruction that has a cond field in bits[31:28], and bits[31:28] of the instruction are not 0b1111.

In the context of the instruction pseudocode, the execution model for an instruction is:

1. Find all encoding diagrams that match the instruction. It is possible that no encoding diagram matches. In that case, abandon this execution model and consult the relevant instruction set chapter instead to find out how the instruction is to be treated. The bit pattern of such an instruction is usually reserved and UNDEFINED, though there are some other possibilities. For example, unallocated hint instructions are documented as being reserved and executed as NOPs.

2. If the operation pseudocode for the matching encoding diagrams starts with a condition code check, perform that check. If the condition code check fails, abandon this execution model and treat the instruction as a NOP. If there are multiple matching encoding diagrams, either all or none of their corresponding pieces of common pseudocode start with a condition code check.
3. Perform the encoding-specific pseudocode for each of the matching encoding diagrams independently and in parallel. Each such piece of encoding-specific pseudocode starts with a bitstring variable for each named bit or multi-bit field in its corresponding encoding diagram, named the same as the bit or multi-bit field and initialized with the values of the corresponding bit or bits from the bit pattern of the instruction.

   In a few cases, the encoding diagram contains more than one bit or field with same name. In these cases, the values of the different instances of those bits or fields must be identical. The encoding-specific pseudocode contains a special case using the `Consistent()` function to specify what happens if they are not identical. `Consistent()` returns `TRUE` if all instruction bits or fields with the same name as its argument have the same value, and `FALSE` otherwise.

   If there are multiple matching encoding diagrams, all but one of the corresponding pieces of pseudocode must contain a special case that indicates that it does not apply. Discard the results of all such pieces of pseudocode and their corresponding encoding diagrams.

   There is now one remaining piece of pseudocode and its corresponding encoding diagram left to consider. This pseudocode might also contain a special case, most commonly one indicating that it is UNPREDICTABLE. If so, abandon this execution model and treat the instruction according to the special case.

4. Check the `should be` bits of the encoding diagram against the corresponding bits of the bit pattern of the instruction. If any of them do not match, abandon this execution model and treat the instruction as UNPREDICTABLE.

5. Perform the rest of the operation pseudocode for the instruction description that contains the encoding diagram. That pseudocode starts with all variables set to the values they were left with by the encoding-specific pseudocode.

   The `ConditionPassed()` call in the common pseudocode, if present, performs step 2, and the `EncodingSpecificOperations()` call performs steps 3 and 4.

### H.2.2 Limitations of the instruction pseudocode

The pseudocode descriptions of instruction functionality have a number of limitations. These are mainly due to the fact that, for clarity and brevity, the pseudocode is a sequential and mostly deterministic language.

These limitations include:

- Pseudocode does not describe the ordering requirements when an instruction generates multiple memory accesses. For a description of the ordering requirements on memory accesses see *Ordering requirements on page E2-2351*.

- Pseudocode does not describe the exact rules when an UNDEFINED instruction fails its condition code check. In such cases, the UNDEFINED pseudocode statement lies inside the `if ConditionPassed() then ... structure, either directly or in the EncodingSpecificOperations() function call, and so the pseudocode indicates that the instruction executes as a NOP. *Conditional execution of undefined instructions on page G1-3478* describes the exact rules.

- Pseudocode does not describe the exact ordering requirements when a single floating-point instruction generates more than one floating-point exception and one or more of those floating-point exceptions is trapped. *Combinations of exceptions on page E1-2309* describes the exact rules.

   **Note**

   There is no limitation in the case where all the floating-point exceptions are untrapped, because the pseudocode specifies the same behavior as the cross-referenced section.

- An exception can be taken during execution of the pseudocode for an instruction, either explicitly as a result of the execution of a pseudocode function such as `Abort()`, or implicitly, for example if an interrupt is taken during execution of an LDM instruction. If this happens, the pseudocode does not describe the extent to which the normal behavior of the instruction occurs. To determine that, see the descriptions of the exceptions in *Handling exceptions that are taken to an Exception level using AArch32 on page G1-3431*.

H.3 Data types

This section describes:
- General data type rules.
- Bitstrings.
- Integers on page AppxH-5064.
- Reals on page AppxH-5064.
- Boolean on page AppxH-5064.
- Enumerations on page AppxH-5064.
- Lists on page AppxH-5065.
- Arrays on page AppxH-5066.

H.3.1 General data type rules

ARM architecture pseudocode is a strongly-typed language. Every constant and variable is of one of the following types:
- Bitstring.
- Integer.
- Boolean.
- Real.
- Enumeration.
- List.
- Array.

The type of a constant is determined by its syntax. The type of a variable is normally determined by assignment to the variable, with the variable being implicitly declared to be of the same type as whatever is assigned to it. For example, the assignments $x = 1$, $y = '1'$, and $z = TRUE$ implicitly declare the variables $x$, $y$ and $z$ to have types integer, bitstring of length 1, and Boolean, respectively.

Variables can also have their types declared explicitly by preceding the variable name with the name of the type. This is most often done in function definitions for the arguments and the result of the function.

The remaining subsections describe each data type in more detail.

H.3.2 Bitstrings

A bitstring is a finite-length string of 0s and 1s. Each length of bitstring is a different type. The minimum permitted length of a bitstring is 1.

The type name for bitstrings of length $n$ is $\text{bits}(n)$. A synonym of $\text{bits}(1)$ is $\text{bit}$.

Bitstring constants are written as a single quotation mark, followed by the string of 0s and 1s, followed by another single quotation mark. For example, the two constants of type $\text{bit}$ are $'0'$ and $'1'$.

Spaces can be included in bitstrings for clarity.

A special form of bitstring constant with 'x' bits is permitted in bitstring comparisons, see Equality and non-equality testing on page AppxH-5069.

Every bitstring value has a left-to-right order, with the bits being numbered in standard little-endian order. That is, the leftmost bit of a bitstring of length $N$ is bit $(N-1)$ and its right-most bit is bit 0. This order is used as the most-significant-to-least-significant bit order in conversions to and from integers. For bitstring constants and bitstrings derived from encoding diagrams, this order matches the way they are printed.

Bitstrings are the only concrete data type in pseudocode, in the sense that they correspond directly to the contents of registers, memory locations, instructions, and so on. All of the remaining data types are abstract.
H.3.3 Integers

Pseudocode integers are unbounded in size and can be either positive or negative. That is, they are mathematical integers rather than what computer languages and architectures commonly call integers. Computer integers are represented in pseudocode as bitstrings of the appropriate length, associated with suitable functions to interpret those bitstrings as integers.

The type name for integers is `integer`.

Integer constants are normally written in decimal, such as 0, 15, -1234. They can also be written in C-style hexadecimal, such as 0x55 or 0x80000000. Hexadecimal integer constants are treated as positive unless they have a preceding minus sign. For example, 0x80000000 is the integer +2^31. If -2^31 needs to be written in hexadecimal, it must be written as -0x80000000.

H.3.4 Reals

Pseudocode reals are unbounded in size and precision. That is, they are mathematical real numbers, not computer floating-point numbers. Computer floating-point numbers are represented in pseudocode as bitstrings of the appropriate length, associated with suitable functions to interpret those bitstrings as reals.

The type name for reals is `real`.

Real constants are written in decimal with a decimal point. This means 0 is an integer constant, but 0.0 is a real constant.

H.3.5 Booleans

A Boolean is a logical ‘TRUE’ or ‘FALSE’ value.

The type name for Booleans is `boolean`. This is not the same type as `bit`, which is a length-1 bitstring. Boolean constants are `TRUE` and `FALSE`.

H.3.6 Enumerations

An enumeration is a defined set of symbolic constants, such as:

```plaintext
enumeration InstrSet {InstrSet_ARM, InstrSet_Thumb, InstrSet_Jazelle, InstrSet_ThumbEE};
```

An enumeration always contains at least one symbolic constant, and a symbolic constant must not be shared between enumerations.

Enumerations must be declared explicitly, although a variable of an enumeration type can be declared implicitly by assigning one of the symbolic constants to it. By convention, each of the symbolic constants starts with the name of the enumeration followed by an underscore. The name of the enumeration is its `type name`, or `type`, and the symbolic constants are its possible `constants`.

--- Note ---

A `boolean` is a pre-declared enumeration that does not follow the normal naming convention and that has a special role in some pseudocode constructs, such as `if` statements. This means the enumeration of a `boolean` is:

```plaintext
enumeration boolean {FALSE, TRUE};
```
H.3.7 Lists

A list is an ordered set of other data items, separated by commas and enclosed in parentheses, for example:

(bits(32) shifter_result, bit shifter_carry_out)

A list always contains at least one data item.

Lists are often used as the return type for a function that returns multiple results. For example, the list at the start of this section is the return type of the function Shift_C() that performs a standard A32/T32 shift or rotation, when its first operand is of type bits(32).

Some specific pseudocode operators use lists surrounded by other forms of bracketing than the (...) parentheses. These are:

- Bitstring extraction operators, that use lists of bit numbers or ranges of bit numbers surrounded by angle brackets <…>.
- Array indexing, that uses lists of array indexes surrounded by square brackets [...].
- Array-like function argument passing, that uses lists of function arguments surrounded by square brackets [...].

Each combination of data types in a list is a separate type, with type name given by listing the data types. This means that the example list at the start of this section is of type (bits(32), bit). The general principle that types can be declared by assignment extends to the types of the individual list items in a list. For example:

(shift_t, shift_n) = ('00', 0);

implicitly declares:

- shift_t to be of type bits(2).
- shift_n to be of type integer.
- (shift_t, shift_n) to be of type (bits(2), integer).

A list type can also be explicitly named, with explicitly named elements in the list. For example:

type ShiftSpec is (bits(2) shift, integer amount);

After this definition and the declaration:

ShiftSpec abc;

The elements of the resulting list can then be referred to as abc.shift and abc.amount. This qualified naming of list elements is only permitted for variables that have been explicitly declared, not for those that have been declared by assignment only.

Explicitly naming a type does not alter what type it is. For example, after the above definition of ShiftSpec, ShiftSpec and (bits(2), integer) are two different names for the same type, not the names of two different types. To avoid ambiguity in references to list elements, it is an error to declare a list variable multiple times using different names of its type or to qualify it with list element names not associated with the name by which it was declared.

An item in a list that is being assigned to can be written as “-” to indicate that the corresponding item of the assigned list value is discarded. For example:

(shifted, -) = LSL_C(operand, amount);

List constants are written as a list of constants of the appropriate types, for example the (‘00’, 0) in the earlier example.
H.3.8 Arrays

Pseudocode arrays are indexed by either enumerations or integer ranges. An integer range is represented by the lower inclusive end of the range, then . . ., then the upper inclusive end of the range.

For example:

```
array bits(64) _R[0..30];
```

Arrays are always explicitly declared, and there is no notation for a constant array. Arrays always contain at least one element, because:

- Enumerations always contain at least one symbolic constant.
- Integer ranges always contain at least one integer.

Arrays do not usually appear directly in pseudocode. The items that syntactically look like arrays in pseudocode are usually array-like functions such as `R[i]`, `MemU[address, size]` or `Elem[vector, i, size]`. These functions package up and abstract additional operations normally performed on accesses to the underlying arrays, such as register banking, memory protection, endian-dependent byte ordering, exclusive-access housekeeping and Advanced SIMD element processing.
H.4 Expressions

This section describes:

- General expression syntax.
- Operators and functions - polymorphism and prototypes on page AppxH-5068.
- Precedence rules on page AppxH-5068.

H.4.1 General expression syntax

An expression is one of the following:
- A constant.
- A variable, optionally preceded by a data type name to declare its type.
- The word `UNKNOWN` preceded by a data type name to declare its type.
- The result of applying a language-defined operator to other expressions.
- The result of applying a function to other expressions.

Variable names normally consist of alphanumeric and underscore characters, starting with an alphabetic or underscore character.

Each register described in the text is to be regarded as declaring a correspondingly named bitstring variable, and that variable has the stated behavior of the register. For example, if a bit of a register is defined as RAZ/WI, then the corresponding bit of its variable reads as 0 and ignore writes.

An expression like `bits(32) UNKNOWN` indicates that the result of the expression is a value of the given type, but the architecture does not specify what value it is and software must not rely on such values. The value produced must not:

- Return information that cannot be accessed at the current or a lower level of privilege using instructions that are not UNPREDICTABLE and do not return UNKNOWN values,
- Be promoted as providing any useful information to software.

Note

UNKNOWN values are similar to the definition of UNPREDICTABLE, but do not indicate that the entire architectural state becomes unspecified.

Only the following expressions are assignable. This means that these are the only expressions that can be placed on the left-hand side of an assignment.

- Variables.
- The results of applying some operators to other expressions.
  The description of each language-defined operator that can generate an assignable expression specifies the circumstances under which it does so. For example, those circumstances might require that one or more of the expressions the operator operates on is an assignable expression.
- The results of applying array-like functions to other expressions. The description of an array-like function specifies the circumstances under which it can generate an assignable expression.

Every expression has a data type.

- For a constant, this data type is determined by the syntax of the constant.
- For a variable, there are the following possible sources for the data type
  - An optional preceding data type name.
  - A data type the variable was given earlier in the pseudocode by recursive application of this rule.
  - A data type the variable is being given by assignment, either by direct assignment to the variable, or by assignment to a list of which the variable is a member.
It is a pseudocode error if none of these data type sources exists for a variable, or if more than one of them exists and they do not agree about the type.

- For a language-defined operator, the definition of the operator determines the data type.
- For a function, the definition of the function determines the data type.

### H.4.2 Operators and functions - polymorphism and prototypes

Operators and functions in pseudocode can be polymorphic, producing different functionality when applied to different data types. Each resulting form of an operator or function has a different prototype definition. For example, the operator `+` has forms that act on various combinations of integers, reals and bitstrings.

One particularly common form of polymorphism is between bitstrings of different lengths. This is represented by using `bits(N)`, `bits(M)`, or similar, in the prototype definition.

### H.4.3 Precedence rules

The precedence rules for expressions are:

1. Constants, variables and function invocations are evaluated with higher priority than any operators using their results.
2. Expressions on integers follow the normal operator precedence rules of exponentiation before multiply/divide before add/subtract, with sequences of multiply/divides or add/subtracts evaluated left-to-right.
3. Other expressions must be parenthesized to indicate operator precedence if ambiguity is possible, but need not be if all permitted precedence orders under the type rules necessarily lead to the same result. For example, if `i`, `j` and `k` are integer variables, `i > 0 && j > 0 && k > 0` is acceptable, but `i > 0 && j > 0 || k > 0` is not.
H.5 Operators and built-in functions

This section describes:

• Operations on generic types.
• Operations on Booleans.
• Bitstring manipulation.
• Arithmetic on page AppxH-5072.

H.5.1 Operations on generic types

The following operations are defined for all types.

Equality and non-equality testing

Any two values \(x\) and \(y\) of the same type can be tested for equality by the expression \(x == y\) and for non-equality by the expression \(x != y\). In both cases, the result is of type boolean.

A special form of comparison is defined with a bitstring constant that includes \('x'\) bits as well as \('0'\) and \('1'\) bits. The bits corresponding to the \('x'\) bits are ignored in determining the result of the comparison. For example, if opcode is a 4-bit bitstring, \(\text{opcode} == '1x0x'\), this matches the values \('1000'\), \('1100'\), \('1001'\) and \('1101'\).

--- Note ---

This special form is permitted in the implied equality comparisons in when parts of case .. of .. structures.

Conditional selection

If \(x\) and \(y\) are two values of the same type and \(t\) is a value of type boolean, then \(\text{if } t \text{ then } x \text{ else } y\) is an expression of the same type as \(x\) and \(y\) that produces \(x\) if \(t\) is TRUE and \(y\) if \(t\) is FALSE.

H.5.2 Operations on Booleans

If \(x\) is a boolean, then \(!x\) is its logical inverse.

If \(x\) and \(y\) are booleans, then \(x \&\& y\) is the result of ANDing them together. As in the C language, if \(x\) is FALSE, the result is determined to be FALSE without evaluating \(y\).

If \(x\) and \(y\) are booleans, then \(x || y\) is the result of ORing them together. As in the C language, if \(x\) is TRUE, the result is determined to be TRUE without evaluating \(y\).

--- Note ---

If \(x\) and \(y\) are booleans, then the result of \(x != y\) is the same as the result of exclusive-ORing \(x\) and \(y\) together.

H.5.3 Bitstring manipulation

The following bitstring manipulation functions are defined:

Bitstring length and most significant bit

If \(x\) is a bitstring:

• The bitstring length function \(\text{Len}(x)\) returns the length of \(x\) as an integer.
• \(\text{TopBit}(x)\) is the leftmost bit of \(x\). Using bitstring extraction, this means:

\[\text{TopBit}(x) = x[\text{Len}(x) - 1].\]
Bitstring concatenation and replication

If \( x \) and \( y \) are bitstrings of lengths \( N \) and \( M \) respectively, then \( x:y \) is the bitstring of length \( N+M \) constructed by concatenating \( x \) and \( y \) in left-to-right order.

If \( x \) is a bitstring and \( n \) is an integer with \( n > 0 \):
- \( \text{Replicate}(x, n) \) is the bitstring of length \( n \cdot \text{Len}(x) \) consisting of \( n \) copies of \( x \) concatenated together.
- \( \text{Zeros}(n) = \text{Replicate}'0', n \), \( \text{Ones}(n) = \text{Replicate}'1', n \).

Bitstring extraction

The bitstring extraction operator extracts a bitstring from either another bitstring or an integer. Its syntax is \( x<i\text{, integer_list}> \), where \( x \) is the integer or bitstring being extracted from, and \( \text{integer_list} \) is a list of integers enclosed in angle brackets rather than the usual parentheses. The length of the resulting bitstring is equal to the number of integers in \( \text{integer_list} \). In \( x<i\text{, integer_list}> \), each of the integers in \( \text{integer_list} \) must be:
- \( \geq 0 \).
- \( < \text{Len}(x) \) if \( x \) is a bitstring.

The definition of \( x<i\text{, integer_list}> \) depends on whether \( \text{integer_list} \) contains more than one integer:
- If \( \text{integer_list} \) contains more than one integer, \( x<i\text{, integer_list}> \) is defined to be the concatenation:
  \[ x<i> : x<j> : x<k> : \ldots : x<n> \].
- If \( \text{integer_list} \) consists of just one integer \( i \), \( x<i> \) is defined to be:
  - If \( x \) is a bitstring, '0' if bit \( i \) of \( x \) is a zero and '1' if bit \( i \) of \( x \) is a one.
  - If \( x \) is an integer, let \( y \) be the unique integer in the range \( 0 \) to \( 2^{\lceil(i+1)/2\rceil}-1 \) that is congruent to \( x \) modulo \( 2^{\lceil(i+1)/2\rceil} \). Then \( x<i> \) is '0' if \( y < 2^i \) and '1' if \( y \geq 2^i \).

Loosely, this definition treats an integer as equivalent to a sufficiently long two’s complement representation of it as a bitstring.

In \( \text{integer_list} \), the notation \( i:j \) with \( i \geq j \) is shorthand for the integers in order from \( i \) down to \( j \), with both end values included. For example, \( \text{instr<31:28>} \) is shorthand for \( \text{instr<31, 30, 29, 28>} \).

The expression \( x<i\text{, integer_list}> \) is assignable provided \( x \) is an assignable bitstring and no integer appears more than once in \( \text{integer_list} \). In particular, \( x<i> \) is assignable if \( x \) is an assignable bitstring and \( 0 \leq i < \text{Len}(x) \).

Encoding diagrams for registers frequently show named bits or multi-bit fields. For example, the encoding diagram for the APSR shows its bit<31> as N. In such cases, the syntax \( \text{APSR}\cdot N \) is used as a more readable synonym for \( \text{APSR<31>} \).

Logical operations on bitstrings

If \( x \) is a bitstring, \( \text{NOT}(x) \) is the bitstring of the same length obtained by logically inverting every bit of \( x \).

If \( x \) and \( y \) are bitstrings of the same length, \( x \text{ AND } y \), \( x \text{ OR } y \), and \( x \text{ EXOR } y \) are the bitstrings of that same length obtained by logically ANDing, ORing, and exclusive-ORing corresponding bits of \( x \) and \( y \) together.

Bitstring count

If \( x \) is a bitstring, \( \text{BitCount}(x) \) produces an integer result equal to the number of bits of \( x \) that are ones.
Testing a bitstring for being all zero or all ones

If $x$ is a bitstring:

- $\text{IsZero}(x)$ produces TRUE if all of the bits of $x$ are zeros and FALSE if any of them are ones.
- $\text{IsZeroBit}(x)$ produces '1' if all of the bits of $x$ are zeros and '0' if any of them are ones.

$\text{IsOnes}(x)$ and $\text{IsOnesBit}(x)$ work in the corresponding ways. This means:

$$
\text{IsZero}(x) = (\text{BitCount}(x) == 0)
$$
$$
\text{IsOnes}(x) = (\text{BitCount}(x) == \text{Len}(x))
$$
$$
\text{IsZeroBit}(x) = \text{if} \text{IsZero}(x) \text{then '1' else '0'}
$$
$$
\text{IsOnesBit}(x) = \text{if} \text{IsOnes}(x) \text{then '1' else '0'}
$$

Lowest and highest set bits of a bitstring

If $x$ is a bitstring, and $N = \text{Len}(x)$:

- $\text{LowestSetBit}(x)$ is the minimum bit number of any of its bits that are ones. If all of its bits are zeros, $\text{LowestSetBit}(x) = N$.
- $\text{HighestSetBit}(x)$ is the maximum bit number of any of its bits that are ones. If all of its bits are zeros, $\text{HighestSetBit}(x) = -1$.
- $\text{CountLeadingZeroBits}(x)$ is the number of zero bits at the left end of $x$, in the range 0 to $N$. This means:
  $$
  \text{CountLeadingZeroBits}(x) = N - 1 - \text{HighestSetBit}(x).
  $$
- $\text{CountLeadingSignBits}(x)$ is the number of copies of the sign bit of $x$ at the left end of $x$, excluding the sign bit itself, and is in the range 0 to $N-1$. This means:
  $$
  \text{CountLeadingSignBits}(x) = \text{CountLeadingZeroBits}(x) \text{EOR} x_{N-1:1} <\text{EOR}\times_{N-2:0} >.
  $$

Zero-extension and sign-extension of bitstrings

If $x$ is a bitstring and $i$ is an integer, then $\text{ZeroExtend}(x, i)$ is $x$ extended to a length of $i$ bits, by adding sufficient zero bits to its left. That is, if $i == \text{Len}(x)$, then $\text{ZeroExtend}(x, i) = x$, and if $i > \text{Len}(x)$, then:

$$
\text{ZeroExtend}(x, i) = \text{Replicate('0', i-Len(x)) : x}
$$

If $x$ is a bitstring and $i$ is an integer, then $\text{SignExtend}(x, i)$ is $x$ extended to a length of $i$ bits, by adding sufficient copies of its leftmost bit to its left. That is, if $i == \text{Len}(x)$, then $\text{SignExtend}(x, i) = x$, and if $i > \text{Len}(x)$, then:

$$
\text{SignExtend}(x, i) = \text{Replicate(TopBit(x), i-Len(x)) : x}
$$

It is a pseudocode error to use either $\text{ZeroExtend}(x, i)$ or $\text{SignExtend}(x, i)$ in a context where it is possible that $i < \text{Len}(x)$.

Converting bitstrings to integers

If $x$ is a bitstring, $\text{SInt}(x)$ is the integer whose two's complement representation is $x$:

```plaintext
// SInt()

integer SInt(bits(N) x)
result = 0;
for i = 0 to N-1
    if x<i> == '1' then result = result + 2^i;
    if x<N-1> == '1' then result = result - 2^N;
```
Appendix H ARM Pseudocode Definition
H.5 Operators and built-in functions

H.5.4 Arithmetic

Most pseudocode arithmetic is performed on integer or real values, with operands being obtained by conversions from bitstrings and results converted back to bitstrings afterwards. As these data types are the unbounded mathematical types, no issues arise about overflow or similar errors.

Unary plus, minus and absolute value

If \( x \) is an integer or real, then \(+x\) is \( x \) unchanged, \(-x\) is \( x \) with its sign reversed, and \( \text{Abs}(x) \) is the absolute value of \( x \). All three are of the same type as \( x \).

Addition and subtraction

If \( x \) and \( y \) are integers or reals, \( x+y \) and \( x-y \) are their sum and difference. Both are of type integer if \( x \) and \( y \) are both of type integer, and real otherwise.

Addition and subtraction are particularly common arithmetic operations in pseudocode, and so it is also convenient to have definitions of addition and subtraction acting directly on bitstring operands.

If \( x \) and \( y \) are bitstrings of the same length \( N \), so that \( N = \text{Len}(x) = \text{Len}(y) \), then \( x+y \) and \( x-y \) are the least significant \( N \) bits of the results of converting them to integers and adding or subtracting them. Signed and unsigned conversions produce the same result:

\[
\begin{align*}
\text{Int}(x+y) &= \text{SInt}(x+y)_{N-1:0} \\
&= \text{UInt}(x+y)_{N-1:0} \\
\text{Int}(x-y) &= \text{SInt}(x-y)_{N-1:0} \\
&= \text{UInt}(x-y)_{N-1:0}
\end{align*}
\]

If \( x \) is a bitstring of length \( N \) and \( y \) is an integer, \( x+y \) and \( x-y \) are the bitstrings of length \( N \) defined by \( x+y = x + y_{N-1:0} \) and \( x-y = x - y_{N-1:0} \). Similarly, if \( x \) is an integer and \( y \) is a bitstring of length \( N \), \( x+y \) and \( x-y \) are the bitstrings of length \( N \) defined by \( x+y = x_{N-1:0} + y \) and \( x-y = x_{N-1:0} - y \).
Comparisons
If $x$ and $y$ are integers or reals, then $x = y$, $x != y$, $x < y$, $x <= y$, $x > y$, and $x >= y$ are equal, not equal, less than, less than or equal, greater than, and greater than or equal comparisons between them, producing Boolean results. In the case of $==$ and $!=$, this extends the generic definition applying to any two values of the same type to also act between integers and reals.

Multiplication
If $x$ and $y$ are integers or reals, then $x \times y$ is the product of $x$ and $y$. It is of type integer if $x$ and $y$ are both of type integer, and real otherwise.

Division and modulo
If $x$ and $y$ are integers or reals, then $x/y$ is the result of dividing $x$ by $y$, and is always of type real.
If $x$ and $y$ are integers, then $x \div y$ and $x \mod y$ are defined by:

\[
\begin{align*}
x \div y &= \text{RoundDown}(x/y) \\
x \mod y &= x - y \times (x \div y)
\end{align*}
\]
It is a pseudocode error to use any of $x/y$, $x \mod y$, or $x \div y$ in any context where $y$ can be zero.

Square root
If $x$ is an integer or a real, $\sqrt{x}$ is its square root, and is always of type real.

Rounding and aligning
If $x$ is a real:
- $\text{RoundDown}(x)$ produces the largest integer $n$ such that $n \leq x$.
- $\text{RoundUp}(x)$ produces the smallest integer $n$ such that $n \geq x$.
- $\text{RoundTowardsZero}(x)$ produces $\text{RoundDown}(x)$ if $x > 0.0$, $0$ if $x == 0.0$, and $\text{RoundUp}(x)$ if $x < 0.0$.

If $x$ and $y$ are both of type integer, $\text{Align}(x, y) = y \times (x \div y)$ is of type integer.

If $x$ is of type bitstring and $y$ is of type integer, $\text{Align}(x, y) = (\text{Align}(\text{ UInt}(x), y)) \ll \text{Len}(x) - 1 : 0$ is a bitstring of the same length as $x$.

It is a pseudocode error to use either form of $\text{Align}(x, y)$ in any context where $y$ can be 0. In practice, $\text{Align}(x, y)$ is only used with $y$ a constant power of two, and the bitstring form used with $y = 2^n$ has the effect of producing its argument with its $n$ low-order bits forced to zero.

Scaling
If $x$ and $n$ are of type integer, then:
- $x << n = \text{RoundDown}(x \times 2^n)$.
- $x >> n = \text{RoundDown}(x \times 2^{-n})$.

Maximum and minimum
If $x$ and $y$ are integers or reals, then $\max(x, y)$ and $\min(x, y)$ are their maximum and minimum respectively. Both are of type integer if $x$ and $y$ are both of type integer, and real otherwise.

Raising to a power
If $x$ is an integer or a real and $n$ is an integer then $x^n$ is the result of raising $x$ to the power of $n$, and:
- If $x$ is of type integer then $x^n$ is of type integer.
- If $x$ is of type real then $x^n$ is of type real.
**H.6 Statements and program structure**

This section describes the control statements used in the pseudocode.

### H.6.1 Simple statements

Each of the following simple statements must be terminated with a semicolon, as shown.

**Assignments**

An assignment statement takes the form:

```plaintext
<assignable_expression> = <expression>;
```

**Procedure calls**

A procedure call takes the form:

```plaintext
<procedure_name>(<arguments>);
```

**Return statements**

A procedure return takes the form:

```plaintext
return;
```

And a function return takes the form:

```plaintext
return <expression>;
```

where `<expression>` is of the type declared in the function prototype line.

**UNDEFINED**

This subsection describes the statement:

```plaintext
UNDEFINED;
```

This statement indicates a special case that replaces the behavior defined by the current pseudocode, apart from behavior required to determine that the special case applies. The replacement behavior is that the Undefined Instruction exception is taken.

**UNPREDICTABLE**

This subsection describes the statement:

```plaintext
UNPREDICTABLE;
```

This statement indicates a special case that replaces the behavior defined by the current pseudocode, apart from behavior required to determine that the special case applies. The replacement behavior is **UNPREDICTABLE**.

**SEE...**

This subsection describes the statement:

```plaintext
SEE <reference>;
```

This statement indicates a special case that replaces the behavior defined by the current pseudocode, apart from behavior required to determine that the special case applies. The replacement behavior is that nothing occurs as a result of the current pseudocode because some other piece of pseudocode defines the required behavior. The `<reference>` indicates where that other pseudocode can be found.

It usually refers to another instruction, but can also refer to another encoding or note of the same instruction.
**IMPLEMENTATION_DEFINED**

This subsection describes the statement:

```
IMPLEMENTATION_DEFINED {<text>};
```

This statement indicates a special case that replaces the behavior defined by the current pseudocode, apart from behavior required to determine that the special case applies. The replacement behavior is IMPLEMENTATION DEFINED. An optional `<text>` field can give more information.

**SUBARCHITECTURE_DEFINED**

This subsection describes the statement:

```
SUBARCHITECTURE_DEFINED {<text>};
```

This statement indicates a special case that replaces the behavior defined by the current pseudocode, apart from behavior required to determine that the special case applies. The replacement behavior is SUBARCHITECTURE DEFINED. An optional `<text>` field can give more information.

**H.6.2 Compound statements**

Indentation normally indicates the structure in compound statements. The statements contained in structures such as `if ... then ... else ...` or procedure and function definitions are indented more deeply than the statement itself, and their end is indicated by returning to the original indentation level or less.

Indentation is normally done by four spaces for each level.

`if ... then ... else ...`

A multi-line `if ... then ... else ...` structure takes the form:

```
if <boolean_expression> then 
   <statement 1>
   <statement 2>
   ...
   <statement n>
elseif <boolean_expression> then 
   <statement a>
   <statement b>
   ...
   <statement z>
else 
   <statement A>
   <statement B>
   ...
   <statement Z>
```

The block of lines consisting of `elsif` and its indented statements is optional, and multiple `elsif` blocks can be used.

The block of lines consisting of `else` and its indented statements is optional.

Abbreviated one-line forms can be used when there are only simple statements in the `then` part and in the `else` part, if it is present, such as:

```
if <boolean_expression> then <statement 1>
if <boolean_expression> then <statement 2> else <statement A>
if <boolean_expression> then <statement 1> <statement 2> else <statement A>
```

--- Note ---

In these forms, `<statement 1>`, `<statement 2>` and `<statement A>` must be terminated by semicolons. This and the fact that the `else` part is optional are differences from the `if ... then ... else ...` expression.
repeat ... until ...

A repeat ... until ... structure takes the form:

```
repeat
  <statement 1>
  <statement 2>
  ...
  <statement n>
until <boolean_expression>;
```

while ... do

A while ... do structure takes the form:

```
while <boolean_expression> do
  <statement 1>
  <statement 2>
  ...
  <statement n>
```

for ...

A for ... structure takes the form:

```
for <assignable_expression> = <integer_expr1> to <integer_expr2>
  <statement 1>
  <statement 2>
  ...
  <statement n>
```

case ... of ...

A case ... of ... structure takes the form:

```
case <expression> of
  when <constant values>
    <statement 1>
    <statement 2>
    ...
    <statement n>
  .. more "when" groups ...
otherwise
  <statement A>
  <statement B>
  ...
  <statement Z>
```

In this structure, <constant values> consists of one or more constant values of the same type as <expression>, separated by commas. Abbreviated one line forms of when and otherwise parts can be used when they contain only simple statements.

If <expression> has a bitstring type, <constant values> can also include bitstring constants containing 'x' bits. For details see Equality and non-equality testing on page AppxH-5069.
Procedure and function definitions

A procedure definition takes the form:

```plaintext
<procedure name>(<argument prototypes>)
  <statement 1>
  <statement 2>
  ...
  <statement n>
```

where `<argument prototypes>` consists of zero or more argument definitions, separated by commas. Each argument definition consists of a type name followed by the name of the argument.

--- Note ---

This first prototype line is not terminated by a semicolon. This helps to distinguish it from a procedure call.

---

A function definition is similar, but also declares the return type of the function:

```plaintext
<return type> <function name>(<argument prototypes>)
  <statement 1>
  <statement 2>
  ...
  <statement n>
```

An array-like function is similar, but with square brackets:

```plaintext
<return type> <function name>[<argument prototypes>]
  <statement 1>
  <statement 2>
  ...
  <statement n>
```

An array-like function also usually has an assignment prototype:

```plaintext
<function name>[<argument prototypes>] = <value prototypes>
  <statement 1>
  <statement 2>
  ...
  <statement n>
```

H.6.3 Comments

Two styles of pseudocode comment exist:
- `//` starts a comment that is terminated by the end of the line.
- `/*` starts a comment that is terminated by `*/`. 
H.7 Miscellaneous helper procedures and functions

The functions described in this section are not part of the pseudocode specification. They are miscellaneous helper procedures and functions used by pseudocode that are not described elsewhere in this manual. Each has a brief description and a pseudocode prototype, except that the prototype is omitted where it is identical to the section title.

H.7.1 ArchVersion()

This function returns the major version number of the architecture.

```plaintext
// ArchVersion()
// =============

integer ArchVersion()
return 8;
```

H.7.2 EndOfInstruction()

This procedure terminates processing of the current instruction.

EndOfInstruction();

H.7.3 GenerateAlignmentException()

This procedure generates the appropriate exception for an alignment error.

In all architecture variants and profiles described in this manual, GenerateAlignmentException() generates a Data Abort exception.

H.7.4 GenerateCoprocessorException()

This procedure generates the appropriate exception for a rejected coprocessor instruction.

In all architecture variants and profiles described in this manual, GenerateCoprocessorException() generates an Undefined Instruction exception.

H.7.5 Hint_Debug()

This procedure supplies a hint to the debug system.

Hint_Debug(bits(4) option);

H.7.6 Hint_PreloadData()

This procedure performs a preload data hint.

Hint_PreloadData(bits(32) address);

H.7.7 Hint_PreloadDataForWrite()

This procedure performs a preload data hint with a probability that the use will be for a write.

Hint_PreloadDataForWrite(bits(32) address);
H.7.8 **Hint_PreloadInstr()**

This procedure performs a *preload instructions* hint.

```c
Hint_PreloadInstr(bits(32) address);
```

H.7.9 **Hint_Yield()**

This procedure performs a *Yield* hint.

```c
Hint_Yield();
```

H.7.10 **IntegerZeroDivideTrappingEnabled()**

This function returns `TRUE` if the trapping of divisions by zero in the integer division instructions `SDIV` and `UDIV` is enabled, and `FALSE` otherwise.

The A-profile `SDIV` and `UDIV` implementation does not support trapping of integer division by zero and therefore this function always returns `FALSE`.

```c
boolean IntegerZeroDivideTrappingEnabled();
```

H.7.11 **IsExternalAbort()**

This function returns `TRUE` if the abort currently being processed is an external abort and `FALSE` otherwise. It is used only in exception entry pseudocode.

```c
boolean IsExternalAbort(Fault type)
    assert type != Fault_None;

boolean IsExternalAbort(FaultRecord fault);
```

H.7.12 **IsAsyncAbort()**

This function returns `TRUE` if the abort currently being processed is an asynchronous abort, and `FALSE` otherwise. It is used only in exception entry pseudocode.

```c
boolean IsAsyncAbort(Fault type)
    assert type != Fault_None;

boolean IsAsyncAbort(FaultRecord fault);
```

H.7.13 **JazelleAcceptsExecution()**

This function indicates whether Jazelle hardware will take over execution when a `BXJ` instruction is executed.

```c
boolean JazelleAcceptsExecution();
```

H.7.14 **LSInstructionSyndrome()**

This function returns the extended syndrome information for a fault reported in the `HSR`.

```c
bits(11) LSInstructionSyndrome();
```

H.7.15 **ProcessorID()**

This function returns an integer that uniquely identifies the executing PE in the system.
integer ProcessorID();

H.7.16 RemapRegsHaveResetValues()

This function returns TRUE if the remap registers PRRR and NMRR have their IMPLEMENTATION DEFINED reset values, and FALSE otherwise.

boolean RemapRegsHaveResetValues();

H.7.17 ThisInstr()

This function returns the bitstring encoding of the currently-executing instruction.

bits(32) ThisInstr();

Note

Currently, this function is used only on 32-bit instruction encodings.

H.7.18 ThisInstrLength()

This function returns the length, in bits, of the current instruction. This means it returns 32 or 16:

integer ThisInstrLength();
Appendix I

Pseudocode Index

This appendix provides indexes to pseudocode definitions and to the pseudocode functions. It contains the following sections:

• Pseudocode operators and keywords on page AppxI-5082.
• Pseudocode indexes on page AppxI-5085.

Note

Status of this appendix in the beta release document

ARM is currently working to improve the organization of the pseudocode in this document, including providing improved linking within the pseudocode. The pseudocode indexes will be added as part of this work. At present, this chapter contains only a list of the pseudocode operators and keywords.
I.1 Pseudocode operators and keywords

Table I-1 shows the pseudocode operators and keywords.

<table>

a. $N$ must be an integer, $x$ can be an integer or a real.
I.2 Pseudocode indexes

Note

ARM is continuing to work on the structuring and linking of the pseudocode in this document. The next release of this manual will include a pseudocode index by function or procedure name.
Appendix I Pseudocode Index
1.2 Pseudocode indexes
Appendix J
Registers Index

This appendix provides indexes to the register descriptions in this manual. It contains the following sections:

• Introduction and register disambiguation on page AppxJ-5088.
• Alphabetical index of AArch64 registers and system instructions on page AppxJ-5092.
• Functional index of AArch64 registers and system instructions on page AppxJ-5102.
• Alphabetical index of AArch32 registers and system instructions on page AppxJ-5113.
• Functional index of AArch32 registers and system instructions on page AppxJ-5122.
• Alphabetical index of memory-mapped registers on page AppxJ-5133.
• Functional index of memory-mapped registers on page AppxJ-5138.
J.1 Introduction and register disambiguation

In some sections of this manual, registers are referred to by a general name, where the description applies to more than one context. Generally, this is one of the following:

- The description applies to both AArch32 state and AArch64 state, and therefore the register names could apply to either AArch32 system registers or AArch64 system registers.
- The description applies to multiple Exception levels, and therefore at a particular Exception level the register names need to take the appropriate Exception level suffix, _EL0, _EL1, _EL2, or _EL3.

The following sections disambiguate the general register names:

- Register name disambiguation by Execution state.
- Register name disambiguation by Exception level on page AppxJ-5091.

J.1.1 Register name disambiguation by Execution state

Table J-1 disambiguates the general names of the registers by Execution state.

Note

The update of the Glossary from ARMv7 to ARMv8 has been started but remains work-in-progress.

A32 instruction
A word that specifies an operation to be performed by a PE that is executing in an Exception level that is using AArch32 and is in A32 state. A32 instructions must be word-aligned.

A32 instructions were previously called ARM instructions, and A32 state was previously called ARM state.

See also A64 instruction, T32 instruction

A64 instruction
A word that specifies an operation to be performed by a PE that is executing in an Exception level that is using AArch64. A64 instructions must be word-aligned.

See also A32 instruction, T32 instruction

AArch32
The 32-bit Execution state. In AArch32 state, addresses are held in 32-bit registers, and instructions in the base instruction sets use 32-bit registers for their processing. AArch32 state supports the T32 and A32 instruction sets.

See also AArch64, A32 instruction, T32 instruction.

AArch64
The 64-bit Execution state. In AArch64 state, addresses are held in 64-bit registers, and instructions in the base instruction set can use 64-bit registers for their processing. AArch64 state supports the A64 instruction set.

See also AArch32, A64 instruction.

Abort
An exception caused by an illegal memory access. Aborts can be caused by the external memory system or the MMU.

Addressing mode
Means a method for generating the memory address used by a load/store instruction.
**Advanced SIMD**
A feature of the ARM architecture that provides SIMD operations on a register file of SIMD and floating-point registers. Where an implementation supports both Advanced SIMD and floating-point instructions, these instructions operate on the same register file.

**Aligned**
A data item stored at an address that is divisible by the highest power of 2 that divides into its size in bytes. Aligned halfwords, words and doublewords therefore have addresses that are divisible by 2, 4 and 8 respectively.

An aligned access is one where the address of the access is aligned to the size of each element of the access.

**Architecturally executed**
An instruction is architecturally executed only if it would be executed in a simple sequential execution of the program. When such an instruction has been executed and retired it has been *architecturally executed*. Any instruction that, in a simple sequential execution of a program, is treated as a *NOP* because it fails its condition code check, is an architecturally executed instruction.

In a PE that performs speculative execution, an instruction is not architecturally executed if the PE discards the results of a speculative execution.

*See also* Condition code check.

**ARM core registers**
Some older documentation uses *ARM core registers* to refer to the following set of registers for execution in AArch32 state:

- The thirteen general-purpose registers, R0-R12, that software can use for processing.
- SP, the *stack pointer*, that can also be referred to as R13.
- LR, the *link register*, that can also be referred to as R14.
- PC, the *program counter*, that can also be referred to as R15.

*See also* General-purpose registers.

**ARM instruction**
*See A32 instruction.*

**Associativity**
*See Cache associativity.*

**Atomicity**
Describes either single-copy atomicity or multi-copy atomicity. *Atomicity in the ARM architecture* on page B2-79 defines these forms of atomicity for the ARM architecture.

*See also* Multi-copy atomicity, Single-copy atomicity.

**Banked register**
A register that has multiple instances, with the instance that is in use depending on the PE mode, Security state, or other PE state.

**Base register**
A register specified by a load/store instruction that is used as the base value for the address calculation for the instruction. Depending on the instruction and its addressing mode, an offset can be added to or subtracted from the base register value to form the virtual address that is sent to memory.

**Base register writeback**
Describes writing back a modified value to the base register used in an address calculation.

**Big-endian memory**
Means that, for example:

- A byte or halfword at a word-aligned address is the most significant byte or halfword in the word at that address.
- A byte at a halfword-aligned address is the most significant byte in the halfword at that address.

**Blocking**
Describes an operation that does not permit following instructions to be executed before the operation completes.

A non-blocking operation can permit following instructions to be executed before the operation completes, and in the event of encountering an exception does not signal an exception to the PE. This enables implementations to retire following instructions while the non-blocking operation is executing, without the need to retain precise PE state.
**Branch prediction**

Is where a PE selects a future execution path to fetch along. For example, after a branch instruction, the PE can choose to speculatively fetch either the instruction following the branch or the instruction at the branch target.

*See also Prefetching.*

**Breakpoint**

A debug event triggered by the execution of a particular instruction, specified by one or both of the address of the instruction and the state of the PE when the instruction is executed.

**Byte**

An 8-bit data item.

**Cache associativity**

The number of locations in a cache set to which an address can be assigned. Each location is identified by its way value.

**Cache level**

The position of a cache in the cache hierarchy. In the ARM architecture, the lower numbered levels are those closest to the PE. For more information see *Terms used in describing the maintenance instructions* on page D4-1680.

**Cache line**

The basic unit of storage in a cache. Its size in words is always a power of two, usually 4 or 8 words. A cache line must be aligned to a suitable memory boundary. A *memory cache line* is a block of memory locations with the same size and alignment as a cache line. Memory cache lines are sometimes loosely called cache lines.

**Cache lockdown**

Enables critical software and data to be loaded into the cache so that the cache lines containing them are not subsequently reallocated. It alleviates the delays caused by accessing a cache in a worst-case situation. This ensures that all subsequent accesses to the software and data concerned are cache hits and so complete quickly.

**Cache miss**

A memory access that cannot be processed at high speed because the data it addresses is not in the cache.

**Cache sets**

Areas of a cache, divided up to simplify and speed up the process of determining whether a cache hit occurs. The number of cache sets is always a power of two.

**Cache way**

A cache way consists of one cache line from each cache set. The cache ways are indexed from 0 to (Associativity-1). Each cache line in a cache way is chosen to have the same index as the cache way. For example, cache way \( n \) consists of the cache line with index \( n \) from each cache set.

**Coherence order**

*See Coherent.*

**Coherent**

Data accesses from a set of observers to a memory location are coherent if accesses to that memory location by the members of the set of observers are consistent with there being a single total order of all writes to that memory location by all members of the set of observers. This single total order of all to writes to that memory location is the *coherence order* for that location.

**Condition code check**

The process of determining whether a conditional instruction executes normally or is treated as a NOP. For an instruction that includes a condition code field, that field is compared with the condition flags to determine whether the instruction is executed normally. For a T32 instruction in an IT block, the value of the ITSTATE register determines whether the instruction is executed normally.

*See also Condition code field, Condition flags, Conditional execution.*

**Condition code field**

A 4-bit field in an instruction that specifies the condition under which the instruction executes.

*See also Condition code check.*

**Condition flags**

The N, Z, C, and V bits of PSTATE, or of the APSR, CPSR, SPSR, or FPSCR. See the register descriptions for more information.

*See also Condition code check, PSTATE.*

**Conditional execution**

When a conditional instruction starts executing, if the condition code check returns TRUE, the instruction executes normally. Otherwise, it is treated as a NOP.

*See also Condition code check.*
CONSTRAINED UNPREDICTABLE
Where an instruction can result in UNPREDICTABLE behavior, the ARMv8 architecture specifies a narrow range of permitted behaviors. This range is the range of CONSTRAINED UNPREDICTABLE behavior. All implementations that are compliant with the architecture must follow the CONSTRAINED UNPREDICTABLE behavior.

See also UNPREDICTABLE.

Context switch
The saving and restoring of computational state when switching between different threads or processes. In this manual, the term context switch describes any situation where the context is switched by an operating system and might or might not include changes to the address space.

Context synchronization operation
One of:
• Performing an ISB operation. An ISB operation is performed when an ISB instruction is executed and does not fail its condition code check.
• Taking an exception.
• Returning from an exception.
• Exit from Debug state.
• Executing a 0CP5 instruction.
• Executing a 0RPS instruction.

The architecture requires a context synchronization operation to guarantee visibility of any change to a system control register.

Digital signal processing (DSP)
Algorithms for processing signals that have been sampled and converted to digital form. DSP algorithms often use saturated arithmetic.

Direct Memory Access (DMA)
An operation that accesses main memory directly, without the PE performing any accesses to the data concerned.

DMA
See Direct Memory Access (DMA).

DNM
See Do-Not-Modify (DNM).

Domain
In the ARM architecture, domain is used in the following contexts.

Shareability domain
Defines a set of observers for which the shareability attributes make the data or unified caches transparent for data accesses.

Power domain
Defines a block of logic with a single, common, power supply.

Memory regions domain
When using the Short-descriptor translation table format, defines a collection of Sections, Large pages and Small pages of memory, that can have their access permissions switched rapidly by writing to the Domain Access Control Register (DACR). ARM deprecates any use of memory regions domains.

Do-Not-Modify (DNM)
Means the value must not be altered by software. DNM fields read as UNKNOWN values, and must only be written with the value read from the same field on the same PE.

Double-precision value
Consists of two consecutive 32-bit words that are interpreted as a basic double-precision floating-point number according to the IEEE 754 standard.

Deprecated
Something that is present in the ARM architecture for backwards compatibility. Whenever possible software must avoid using deprecated features. Features that are deprecated but are not optional are present in current implementations of the ARM architecture, but might not be present, or might be deprecated and OPTIONAL, in future versions of the ARM architecture.

See also OPTIONAL.

Doubleword
A 64-bit data item. Doublewords are normally at least word-aligned in ARM systems.
Doubleword-aligned
Means that the address is divisible by 8.

DSP
See Digital signal processing (DSP).

Endianness
An aspect of the system memory mapping.
See also Big-endian memory and Little-endian memory.

Exception
Handles an event. For example, an exception could handle an external interrupt or an undefined instruction.

Exception vector
A fixed address that contains the address of the first instruction of the corresponding exception handler.

Execution stream
The stream of instructions that would have been executed by sequential execution of the program.

Explicit access
A read from memory, or a write to memory, generated by a load or store instruction executed by the PE. Reads and
writes generated by hardware translation table accesses are not explicit accesses.

External abort
An abort that is generated by the external memory system.

Fast Context Switch Extension (FCSE)
Modifies the behavior of an ARM memory system to enable multiple programs running on the ARM PE to use
identical address ranges, while ensuring that the addresses they present to the rest of the memory system differ. From
ARMv6, ARM deprecates any use of the FCSE. The FCSE is:
• Optional in an ARMv7 implementation that does not include the Multiprocessing Extensions.
• Obsolete from the introduction of the Multiprocessing Extensions.

FCSE
See Fast Context Switch Extension (FCSE).

Flat address mapping
Is where the physical address for every access is equal to its virtual address.

Flush-to-zero mode
A special processing mode that optimizes the performance of some floating-point algorithms by replacing the
denormalized operands and intermediate results with zeros, without significantly affecting the accuracy of their
final results.

General-purpose registers
The registers that the base instructions use for processing:
• In AArch32 state the general-purpose registers are R0-R14, that can also be described as R0-R12, SP, LR.

Note
Older documentation defines the AArch32 general-purpose registers as R0-R12, and the ARM core registers
as R0-R12, SP, LR, and PC.

• In AArch64 state the general-purpose registers are:
  — W0-W30 when accessed as 32-bit registers.
  — X0-X30 when accessed as 64-bit registers.

See also High registers, Low registers.

Halfword
A 16-bit data item. Halfwords are normally halfword-aligned in ARM systems.

Halfword-aligned
Means that the address is divisible by 2.
High registers

In AArch32 state, the general-purpose registers R8-R14. Most 16-bit T32 instructions cannot access the high registers.

Note

- In some contexts, high registers refers to R8-R15, meaning R8-R14 and the PC.

See also General-purpose registers, Low registers.

High vectors

An alternative location for the exception vectors. The high vector address range is near the top of the address space, rather than at the bottom.

Immediate and offset fields

Are unsigned unless otherwise stated.

Immediate value

A value that is encoded directly in the instruction and used as numeric data when the instruction is executed. Many A64, A32, and T32 instructions can be used with an immediate argument.

IMP

An abbreviation used in diagrams to indicate that one or more bits have IMPLEMENTATION DEFINED behavior.

IMPLEMENTATION DEFINED

Means that the behavior is not architecturally defined, but must be defined and documented by individual implementations. In body text, the term IMPLEMENTATION DEFINED is shown in SMALL CAPITALS.

Index register

A register specified in some load and store instructions. The value of this register is used as an offset to be added to or subtracted from the base register value to form the virtual address that is sent to memory. Some instruction forms permit the index register value to be shifted before the addition or subtraction.

Inline literals

These are constant addresses and other data items held in the same area as the software itself. They are automatically generated by compilers, and can also appear in assembler code.

Intermediate Physical Address (IPA)

An implementation of virtualization, the address to which an Guest OS maps a VA. A hypervisor might then map the IPA to a PA. Typically, the Guest OS is unaware of the translation from IPA to PA.

See also Physical address (PA), Virtual address (VA).

Interworking

A method of working that permits branches between software using the A32 and T32 instruction sets.

IPA

See Intermediate Physical Address (IPA).

Level

See Cache level.

Level of coherence (LoC)

The last level of cache that must be cleaned or invalidated when cleaning or invalidating to the point of coherency. For more information see Terms used in describing the maintenance instructions on page D4-1680.

See also Cache level, Point of coherency (PoC).

Level of unification, Inner Shareable (LoUIS)

The last level of cache that must be cleaned or invalidated when cleaning or invalidating to the point of unification for the Inner Shareable shareability domain. For more information see Terms used in describing the maintenance instructions on page D4-1680.

See also Cache level, Point of unification (PoU).

Level of unification, uniprocessor (LoUU)

For a PE, the last level of cache that must be cleaned or invalidated when cleaning or invalidating to the point of unification for that PE. For more information see Terms used in describing the maintenance instructions on page D4-1680.

See also Cache level, Point of unification (PoU).

Line

See Cache level.
Little-endian memory
Means that:

- A byte or halfword at a word-aligned address is the least significant byte or halfword in the word at that address.
- A byte at a halfword-aligned address is the least significant byte in the halfword at that address.

Load/Store architecture
An architecture where data-processing operations only operate on register contents, not directly on memory contents.

LoC
See Level of coherence (LoC).

LoUIS
See Level of unification, Inner Shareable (LoUIS).

LoUU
See Level of unification, uniprocessor (LoUU).

Lockdown
See Cache lockdown.

Low registers
In AArch32 state, general-purpose registers R0-R7. Unlike the high registers, all T32 instructions can access the Low registers.
See also General-purpose registers. High registers.

Memory barrier
See Memory barriers on page B2-85

Memory coherency
The problem of ensuring that when a memory location is read, either by a data read or an instruction fetch, the value actually obtained is always the value that was most recently written to the location. This can be difficult when there are multiple possible physical locations, such as main memory and at least one of a write buffer and one or more levels of cache.

Memory Management Unit (MMU)
Provides detailed control of the part of a memory system that provides a single stage of address translation. Most of the control is provided using translation tables that are held in memory, and define the attributes of different regions of the physical memory map.

Memory Protection Unit (MPU)
A hardware unit whose registers provide simple control of a limited number of protection regions in memory.

Miss
See Cache miss.

MMU
See Memory Management Unit (MMU).

MPU
See Memory Protection Unit (MPU).

Multi-copy atomicity
The form of atomicity described in Requirements for multi-copy atomicity on page B2-80.
See also Atomicity, Single-copy atomicity.

NaN
Special floating-point values that can be used when neither a numeric value nor an infinity is appropriate. NaNs can be quiet NaNs that propagate through most floating-point operations, or signaling NaNs that cause Invalid Operation floating-point exceptions when used. For more information, see the IEEE 754 standard.

Natural eviction
A natural eviction is an eviction that occurs in the course of the normal operation of the memory system, rather than because of an operation that explicitly causes an eviction from the cache, such as a cache maintenance operation. Typically, a natural eviction occurs when the caching algorithm requires data to be cached but the cache does not have room for that data.

Observer
A PE or mechanism in the system, such as a peripheral device, that can generate reads from or writes to memory.

Obsolete
Obsolete indicates something that is no longer supported by ARM. When an architectural feature is described as obsolete, this indicates that the architecture has no support for that feature, although an earlier version of the architecture did support it.
Offset addressing
Means that the memory address is formed by adding or subtracting an offset to or from the base register value.

OPTIONAL
When applied to a feature of the architecture, OPTIONAL indicates a feature that is not required in an implementation of the ARM architecture:

• If a feature is OPTIONAL and deprecated, this indicates that the feature is being phased out of the architecture. ARM expects such a feature to be included in a new implementation only if there is a known backwards-compatibility reason for the inclusion of the feature.
  A feature that is OPTIONAL and deprecated might not be present in future versions of the architecture.
• A feature that is OPTIONAL but not deprecated is, typically, a feature added to a version of the ARM architecture after the initial release of that version of the architecture. ARM recommends that such features are included in all new implementations of the architecture.

In body text, these meanings of the term OPTIONAL are shown in SMALL CAPITALS.

Note: Do not confuse these ARM-specific uses of OPTIONAL with other uses of optional, where it has its usual meaning. These include:

• Optional arguments in the syntax of many instructions.
• Behavior determined by an implementation choice, for example the optional byte order reversal in an ARMv7-R implementation, where the SCTLR.IE bit indicates the implemented option.

See also Deprecated.

PA
See Physical address (PA).

PE
See Processing element (PE).

Physical address (PA)
An address that identifies a location in the physical memory map.

See also Intermediate Physical Address (IPA), Virtual address (VA).

PoC
See Point of coherency (PoC).

PoU
See Point of unification (PoU).

Point of coherency (PoC)
For a particular MVA, the point at which all agents that can access memory are guaranteed to see the same copy of a memory location. For more information see Terms used in describing the maintenance instructions on page D4-1680.

Point of unification (PoU)
For a particular PE, the point by which the instruction and data caches and the translation table walks of that PE are guaranteed to see the same copy of a memory location. For more information see Terms used in describing the maintenance instructions on page D4-1680.

Post-indexed addressing
Means that the memory address is the base register value, but an offset is added to or subtracted from the base register value and the result is written back to the base register.

Prefetching
Prefetching refers to speculatively fetching instructions or data from the memory system. In particular, instruction prefetching is the process of fetching instructions from memory before the instructions that precede them, in simple sequential execution of the program, have finished executing. Prefetching an instruction does not mean that the instruction has to be executed.

In this manual, references to instruction or data fetching apply also to prefetching, unless the context explicitly indicates otherwise.

Note, in particular, that the Prefetch Abort exception can be generated on any instruction fetch, and is not limited to speculative instruction fetches.
Pre-indexed addressing
Means that the memory address is formed in the same way as for offset addressing, but the memory address is also written back to the base register.

Processing element (PE)
The abstract machine defined in the ARM architecture, as documented in an ARM Architecture Reference Manual. A PE implementation compliant with the ARM architecture must conform with the behaviors described in the corresponding ARM Architecture Reference Manual.

Protection region
A memory region whose position, size, and other properties are defined by Memory Protection Unit registers.

Protection Unit
See Memory Protection Unit (MPU).

Pseudo-instruction
UAL assembler syntax that assembles to an instruction encoding that is expected to disassemble to a different assembler syntax, and is described in this manual under that other syntax. For example, MOV <Rd>, <Rn>, LSL #<n> is a pseudo-instruction that is expected to disassemble as LSL <Rd>, <Rn>, #<n>.

PSTATE
An abstraction of process state information. All of the instruction sets provide instructions that operate on elements of PSTATE.
See also Condition flags.

Quadword
A 128-bit data item. Quadwords are normally at least word-aligned in ARM systems.

Quadword-aligned
Means that the address is divisible by 16.

Quiet NaN
A NaN that propagates unchanged through most floating-point operations.

RAO
See Read-As-One (RAO)

RAZ
See Read-As-Zero (RAZ)

RAO/SBOP
In versions of the ARM architecture before ARMv8, Read-As-One, Should-Be-One-or-Preserved on writes.
In ARMv8, RES1 replaces this description.
See also UNK/SBOP, Read-As-One (RAO), Should-Be-One-or-Preserved (SBOP).

RAO/WI
Read-As-One, Writes Ignored.
Hardware must implement the field as Read-as-One, and must ignore writes to the field.
Software can rely on the field reading as all 1s, and on writes being ignored.
This description can apply to a single bit that reads as 1, or to a field that reads as all 1s.
See also Read-As-One (RAO).

RAZ/SBZP
In versions of the ARM architecture before ARMv8, Read-As-Zero, Should-Be-Zero-or-Preserved on writes.
In ARMv8, RES0 replaces this description.
See also UNK/SBZP, Read-As-Zero (RAZ), Should-Be-Zero-or-Preserved (SBZP).

RAZ/WI
Read-As-Zero, Writes Ignored.
Hardware must implement the field as Read-as-Zero, and must ignore writes to the field.
Software can rely on the field reading as all 0s, and on writes being ignored.
This description can apply to a single bit that reads as 0, or to a field that reads as all 0s.
See also Read-As-Zero (RAZ).

Read-allocate cache
A cache in which a cache miss on reading data causes a cache line to be allocated into the cache.
Read-As-One (RAO)
Hardware must implement the field as reading as all 1s.
Software can rely on the field reading as all 1s.
This description can apply to a single bit that reads as 1, or to a field that reads as all 1s.

Read-As-Zero (RAZ)
Hardware must implement the field as reading as all 0s.
Software can rely on the field reading as all 0s
This description can apply to a single bit that reads as 0, or to a field that reads as all 0s.

Read, modify, write
In a read, modify, write instruction sequence, a value is read to a general-purpose register, the relevant fields updated in that register, and the new value written back.

RES0
Hardware must implement the bit as Read-As-Zero, and must ignore writes to the field.
Software must not rely on the field reading as all 0s, and except for writing back to the register must treat the value as if it is UNKNOWN. Software must use an SBZP policy to write to the field.
This description can apply to a single bit that should be written as its preserved value or as 0, or to a field that should be written as its preserved value or as all 0s.
This definition of RES0 applies only to a bit or field that is RES0 in all contexts. In the ARM architecture a small number of fields are RES0 in one context, and have different behavior in another context. An extended definition of RES0 applies to these bits, see Fixed values in instruction and register descriptions on page C4-230.
In body text, the term RES0 is shown in SMALL CAPITALS.
See also Read-As-Zero (RAZ), Should-Be-Zero-or-Preserved (SBZP), UNKNOWN.

RES1
Hardware must implement the field as Read-As-One, and must ignore writes to the field.
Software must not rely on the field reading as all 1s, and except for writing back to the register it must treat the value as if it is UNKNOWN. Software must use an SBOP policy to write to the field.
This description can apply to a single bit that should be written as its preserved value or as 1, or to a field that should be written as its preserved value or as all 1s.
This definition of RES1 applies only to a bit or field that is RES1 in all contexts. In the ARM architecture a small number of fields are RES1 in one context, and have different behavior in another context. An extended definition of RES1 applies to these bits, see Fixed values in instruction and register descriptions on page C4-230.
In body text, the term RES1 is shown in SMALL CAPITALS.
See also Read-As-One (RAO), Should-Be-One-or-Preserved (SBOP), UNKNOWN.

Reserved
Unless otherwise stated:
• Instructions that are reserved or that access reserved registers have UNPREDICTABLE behavior.
• Bit positions described as reserved are:
  — In an RW register, RES0.
  — In an RO register, UNK.
  — In a WO register, RES0.

RISC
Reduced Instruction Set Computer.

Rounding error
The value of the rounded result of an arithmetic operation minus the exact result of the operation.

Rounding mode
Specifies how the rounded result of a floating-point operation is rounded to a value that is representable in the destination format.

Round to Nearest (RN) mode
Means that the rounded result is the nearest representable number to the unrounded result.
Round towards Plus Infinity (RP) mode
Means that the rounded result is the nearest representable number that is greater than or equal to the exact result.

Round towards Minus Infinity (RM) mode
Means that the rounded result is the nearest representable number that is less than or equal to the exact result.

Round towards Zero (RZ) mode
Means that results are rounded to the nearest representable number that is no greater in magnitude than the unrounded result.

Saturated arithmetic
Integer arithmetic in which a result that would be greater than the largest representable number is set to the largest representable number, and a result that would be less than the smallest representable number is set to the smallest representable number. Signed saturated arithmetic is often used in DSP algorithms. It contrasts with the normal signed integer arithmetic used in ARM processors, in which overflowing results wrap around from $2^{31} - 1$ to $-2^{31}$ or vice versa.

SBO
See Should-Be-One (SBO).

SBOP
See Should-Be-One-or-Preserved (SBOP).

SBZ
See Should-Be-Zero (SBZ).

SBZP
See Should-Be-Zero-or-Preserved (SBZP).

Security hole
A mechanism by which execution at the current level of privilege can achieve an outcome that cannot be achieved at the current or a lower level of privilege using instructions that are not UNPREDICTABLE. The ARM architecture forbids security holes.

Self-modifying code
Code that writes one or more instructions to memory and then executes them. When using self-modifying code you must use cache maintenance and barrier instructions to ensure synchronization. For more information see Caches and memory hierarchy on page B2-70.

Set
See Cache sets.

Should-Be-One (SBO)
Hardware must ignore writes to the field.
Software should write the field as all 1s. If software writes a value that is not all 1s, it must expect an UNPREDICTABLE result.
This description can apply to a single bit that should be written as 1, or to a field that should be written as all 1s.

Should-Be-One-or-Preserved (SBOP)
From the introduction of the ARMv7 Large Physical Address Extension the definition of SBOP is modified for register bits that are SBOP in some but not all contexts. For more information see Meaning of fixed bit values in register diagrams on page G3-3711. The generic definition of SBOP given here applies only to bits that are not affected by this modification.
Hardware must ignore writes to the field.
If software has read the field since the PE implementing the field was last reset and initialized, it should preserve the value of the field by writing the value that it previously read from the field. Otherwise, it should write the field as all 1s.
If software writes a value to the field that is not a value previously read for the field and is not all 1s, it must expect an UNPREDICTABLE result.
This description can apply to a single bit that should be written as its preserved value or as 1, or to a field that should be written as its preserved value or as all 1s.

Should-Be-Zero (SBZ)
Hardware must ignore writes to the field.
Software should write the field as all 0s. If software writes a value that is not all 0s, it must expect an UNPREDICTABLE result.
This description can apply to a single bit that should be written as 0, or to a field that should be written as all 0s.

**Should-Be-Zero-or-Preserved (SBZP)**

From the introduction of the ARMv7 Large Physical Address Extension, the definition of SBZP is modified for register bits that are SBZP in some but not all contexts. For more information see *Meaning of fixed bit values in register diagrams* on page G3-3711. The generic definition of SBZP given here applies only to bits that are not affected by this modification.

Hardware must ignore writes to the field.

If software has read the field since the PE implementing the field was last reset and initialized, it must preserve the value of the field by writing the value that it previously read from the field. Otherwise, it must write the field as all 0s.

If software writes a value to the field that is not a value previously read for the field and is not all 0s, it must expect an UNPREDICTABLE result.

This description can apply to a single bit that should be written as its preserved value or as 0, or to a field that should be written as its preserved value or as all 0s.

**Signaling NaNs**

Cause an Invalid Operation exception whenever any floating-point operation receives a signaling NaN as an operand. Signaling NaNs can be used in debugging, to track down some uses of uninitialized variables.

**Signed immediate and offset fields**

Are encoded in two's complement notation unless otherwise stated.

**SIMD**

Single-Instruction, Multiple-Data.

The SIMD instructions in AArch32 state are:

- The instructions summarized in *Parallel addition and subtraction instructions* on page F1-2389.
- The Advanced SIMD instructions summarized in *Advanced SIMD and floating-point instructions* on page E1-2303, when operating on vectors.

**Note**

In ARMv7, some VFP instructions can operate on vectors. However, ARM deprecates those instruction uses, and strongly recommends that Advanced SIMD instructions are always used for vector operations.

**Simple sequential execution**

The behavior of an implementation that fetches, decodes and completely executes each instruction before proceeding to the next instruction. Such an implementation performs no speculative accesses to memory, including to instruction memory. The implementation does not pipeline any phase of execution. In practice, this is the theoretical execution model that the architecture is based on, and ARM does not expect this model to correspond to a realistic implementation of the architecture.

**Single-copy atomicity**

The form of atomicity described in *Single-copy atomicity* on page B2-79.

See also *Atomicity, Multi-copy atomicity*.

**Single-precision value**

A 32-bit word that is interpreted as a basic single-precision floating-point number according to the IEEE 754 standard.

**Spatial locality**

The observed effect that after a program has accessed a memory location, it is likely to also access nearby memory locations in the near future. Caches with multi-word cache lines exploit this effect to improve performance.

**SUBARCHITECTURE DEFINED**

Means that the behavior is expected to be specified by a subarchitecture definition. This definition might be shared by multiple implementations, but it must not be relied on by architecturally-portable software.

Subarchitecture definitions are used for:

- The interface between an ARMv7 VFP Extension implementation and its support code.
- The interface between an ARMv7 implementation of the Jazelle extension and an Enabled JVM.
In body text, the term SUBARCHITECTURE DEFINED is shown in SMALL CAPITALS.

**T32 instruction**

One or two halfwords that specify an operation to be performed by a PE that is executing in an Exception level that is using AArch32 and is in T32 state. T32 instructions must be halfword-aligned.

T32 instructions were previously called Thumb instructions, and T32 state was previously called Thumb state.

*See also* A32 instruction, A64 instruction

**Temporal locality**

The observed effect that after a program has accesses a memory location, it is likely to access the same memory location again in the near future. Caches exploit this effect to improve performance.

**Thumb instruction**

*See* T32 instruction.

**TLB**

*See* Translation Lookaside Buffer (TLB).

**TLB lockdown**

A way to prevent specific translation table walk results being accessed. This ensures that accesses to the associated memory areas never cause a translation table walk.

**Translation Lookaside Buffer (TLB)**

A memory structure containing the results of translation table walks. They help to reduce the average cost of a memory access. Usually, there is a TLB for each memory interface of the ARM implementation.

**Translation table**

A table held in memory that defines the properties of memory areas of various sizes from 1KB to 1MB.

**Translation table walk**

The process of doing a full translation table lookup. It is performed automatically by hardware.

**Trap enable bits**

In VFPv2, VFPv3U, and VFPv4U, determine whether trapped or untrapped exception handling is selected. If trapped exception handling is selected, the way it is carried out is IMPLEMENTATION DEFINED.

**Unaligned**

An unaligned access is an access where the address of the access is not aligned to the size of an element of the access.

**Unaligned memory accesses**

Are memory accesses that are not, or might not be, appropriately halfword-aligned, word-aligned, or doubleword-aligned.

**Unallocated**

Except where otherwise stated, an instruction encoding is unallocated if the architecture does not assign a specific function to the entire bit pattern of the instruction, but instead describes it as UNDEFINED, UNPREDICTABLE, or an unallocated hint instruction.

A bit in a register is unallocated if the architecture does not assign a function to that bit.

**UNDEFINED**

Indicates an instruction that generates an Undefined Instruction exception.

*In body text, the term UNDEFINED is shown in SMALL CAPITALS.*

*See also* Undefined Instruction exception on page G1-3476.

**Unified cache**

Is a cache used for both processing instruction fetches and processing data loads and stores.

**Unindexed addressing**

Means addressing in which the base register value is used directly as the virtual address to send to memory, without adding or subtracting an offset. In most types of load/store instruction, unindexed addressing is performed by using offset addressing with an immediate offset of 0. The LDC, LDC2, STC, and STC2 instructions have an explicit unindexed addressing mode that permits the offset field in the instruction to specify additional coprocessor options.

**UNK**

An abbreviation indicating that software must treat a field as containing an UNKNOWN value.

Hardware must implement the bit as read as 0, or all 0s for a bit field. Software must not rely on the field reading as zero.

*See also* UNKNOWN.

**UNK/SBOP**

Hardware must implement the field as Read-As-One, and must ignore writes to the field.
Software must not rely on the field reading as all 1s, and except for writing back to the register it must treat the value as if it is UNKNOWN. Software must use an SBOP policy to write to the field.

This description can apply to a single bit that should be written as its preserved value or as 1, or to a field that should be written as its preserved value or as all 1s.

See also Read-As-One (RAO), Should-Be-One-or-Preserved (SBOP), UNKNOWN.

UNK/SBZP

Hardware must implement the bit as Read-As-Zero, and must ignore writes to the field.

Software must not rely on the field reading as all 0s, and except for writing back to the register must treat the value as if it is UNKNOWN. Software must use an SBZP policy to write to the field.

This description can apply to a single bit that should be written as its preserved value or as 0, or to a field that should be written as its preserved value or as all 0s.

See also Read-As-Zero (RAZ), Should-Be-Zero-or-Preserved (SBZP), UNKNOWN.

UNKNOWN

An UNKNOWN value does not contain valid data, and can vary from moment to moment, instruction to instruction, and implementation to implementation. An UNKNOWN value must not return information that cannot be accessed at the current or a lower level of privilege using instructions that are not UNPREDICTABLE and do not return UNKNOWN values.

An UNKNOWN value must not be documented or promoted as having a defined value or effect.

In body text, the term UNKNOWN is shown in SMALL CAPITALS.

See also UNK.

UNPREDICTABLE

Means the behavior cannot be relied upon. UNPREDICTABLE behavior must not perform any function that cannot be performed at the current or a lower level of privilege using instructions that are not UNPREDICTABLE.

UNPREDICTABLE behavior must not be documented or promoted as having a defined effect.

An instruction that is UNPREDICTABLE can be implemented as UNDEFINED.

Execution in a Non-secure EL1 or EL0 mode of an instruction that is UNPREDICTABLE can be implemented as generating a Hyp Trap exception, provided that at least one instruction that is not UNPREDICTABLE causes a Hyp Trap exception.

In body text, the term UNPREDICTABLE is shown in SMALL CAPITALS.

See also CONSTRAINED UNPREDICTABLE.

VA

See Virtual address (VA).

VFP

In ARMv7, an extension to the ARM architecture, that provides single-precision and double-precision floating-point arithmetic.

Virtual address (VA)

An address generated by an ARM PE. This means it is an address that might be held in the program counter of the PE. For a PMSA implementation, the virtual address is identical to the physical address.

See also Intermediate Physical Address (IPA), Physical address (PA).

Watchpoint

A debug event triggered by an access to memory, specified in terms of the address of the location in memory being accessed.

Way

See Cache way.

Word

A 32-bit data item. Words are normally word-aligned in ARM systems.

Word-aligned

Means that the address is divisible by 4.

Write-allocate cache

A cache in which a cache miss on storing data causes a cache line to be allocated into the cache.
**Write-back cache**
A cache in which when a cache hit occurs on a store access, the data is only written to the cache. Data in the cache can therefore be more up-to-date than data in main memory. Any such data is written back to main memory when the cache line is cleaned or reallocated. Another common term for a write-back cache is a *copy-back cache*.

**Write-through cache**
A cache in which when a cache hit occurs on a store access, the data is written both to the cache and to main memory. This is normally done via a write buffer, to avoid slowing down the PE.

**Write buffer**
A block of high-speed memory that optimizes stores to main memory.
